AI for Lancaster

Leo Guinan

AI for Main Street

A No-Hype Guide for Lancaster Small Business Owners

By Leo Guinan

For every business owner in Fairfield County who's been told they need AI but hasn't been told the truth about it.

About the Author

Leo Guinan is the founder of AI for Lancaster, a local technology company based in Lancaster, Ohio. He builds AI systems — the practical kind that process information, make predictions, and automate repetitive work. His prediction track record is 42%, which means he's wrong more than he's right. He publishes his predictions before he knows the outcomes and publishes the misses with the same weight as the hits.

He lives in Lancaster with his wife and kids. His email is Leo@aiforlancaster.com. He'd rather hear from you than not.

Table of Contents

Part One: The Bullshit Detector

- Chapter 1: The AI Gold Rush Is Coming to Main Street
- Chapter 2: What AI Actually Is (In Plain English)

Part Two: The Monday Morning Playbook

- Chapter 3: The Free Tools You Should Be Using Today
- Chapter 4: Email and Communication (Save 5 Hours a Week)
- Chapter 5: Marketing Without a Marketing Department
- Chapter 6: Operations — The Boring Stuff That Makes You Money

Part Three: The AI Audit

- Chapter 7: The $0 AI Audit — Walk Through Your Own Business
- Chapter 8: Scoring Your Opportunities

Part Four: When to Get Help

- Chapter 9: AI Voice Agents — The Website of 2025
- Chapter 10: Custom Automations — When Off-the-Shelf Isn't Enough
- Chapter 11: How to Hire an AI Consultant (Without Getting Burned)

Part Five: The Lancaster Appendix

- Chapter 12: AI for Fairfield County

Appendices

- Appendix A: The Prompt Library (50 Copy-Paste Prompts)
- Appendix B: The AI Tool Comparison Chart
- Appendix C: The BS Detector Checklist

Part One: The Bullshit Detector

Chapter 1: The AI Gold Rush Is Coming to Main Street

There are about 800,000 management consultants in the United States right now. In five years, there will probably be that many people calling themselves "AI consultants." A good portion of them will be showing up at your door.

Some of them will be genuinely helpful. Most of them will be selling you something you don't need, built on technology they don't fully understand, for a problem you might not actually have.

I'm writing this book so you can tell the difference.

Who I Am and Why You Should Listen (Cautiously)

My name is Leo Guinan. I live in Lancaster, Ohio. I've been building AI systems for years — not the kind you see in movies, but the practical kind: tools that process information, make predictions, automate repetitive work.

Here's something most AI consultants won't tell you: my prediction track record is about 42%. That means I'm wrong more than I'm right. I publish my predictions before I know the outcomes, and I publish the misses with the same weight as the hits.

Why would I lead with that? Because it's the most important thing about me. Anyone who tells you they know exactly what AI will do for your business is either lying or delusional. The honest answer is: it depends. It depends on your business, your customers, your workflows, and what you're actually willing to change.

What I CAN tell you — with high confidence — is what AI does well right now, what it does poorly, and how to spot the difference between someone who wants to help you and someone who wants your money.

The Pattern You've Seen Before

If you've been in business for more than ten years, you've already survived one of these cycles. Remember when everyone needed a website? Around 2005-2010, a wave of "web consultants" rolled through every small town in America.

Some of them built good websites for fair prices. A lot of them charged $10,000 for something that was worth $500. Some of them disappeared after cashing the check.

The same thing happened with social media marketing around 2015. And "digital transformation" around 2020. Same pattern every time:

1. New technology emerges that genuinely matters
2. Early adopters figure it out and get real advantages
3. A gold rush of consultants floods the market
4. Most of the consultants know less than they claim
5. Small businesses get burned
6. The technology eventually becomes normal and affordable
7. Everyone uses it, no consultant needed

We’re at step 3 right now with AI. The technology is real. The advantages are real. But the gold rush means you need to be careful about who you trust.

The Five Red Flags of AI Snake Oil

I want to give you a simple checklist. Tape this to the wall behind your desk. Any time someone walks into your business or sends you an email about AI services, run them through these five questions.

Red Flag #1: They Promise Revenue Multiples Without Specifics

“AI will 10x your revenue!” is not a business proposal. It’s a bumper sticker.

If someone tells you AI will dramatically increase your revenue, the very next word out of your mouth should be: “How, specifically?” And the answer should involve YOUR business, YOUR numbers, and a mechanism you can understand.

“We’ll set up a voice agent that answers your phone 24/7. Based on your current call volume of 40 calls per week and the fact that you’re missing about 30% of them, we estimate you’ll capture an additional 12 calls per week. At your average ticket of $200, that’s roughly $2,400 per month in recovered revenue.”

That’s a specific claim you can evaluate. “10x your revenue with AI” is not.

Red Flag #2: They Can’t Demo It Live With Your Data

This is the most important test. If someone is selling you an AI tool or service, ask them to show it working — right now, with information from your actual business.

Not a pre-recorded demo. Not a PowerPoint. Not “we’ll build it after you sign.” Right now, in front of you, with your data.

If they can’t do that, one of two things is true: they don’t actually have a working product, or their product doesn’t work well enough to show in an uncontrolled environment. Either way, keep your wallet closed.

Red Flag #3: The Pricing Is Based on “Value,” Not Costs

“This is worth $50,000 in value to your business” is a classic consulting trick. It’s not wrong — value-based pricing is legitimate — but when the underlying tool costs $50 per month to run and took 10 hours to set up, charging $50,000 is not value-based pricing. It’s exploitation of your unfamiliarity with the technology.

A trustworthy AI consultant should be willing to explain their actual costs. “The voice agent platform costs me $75 per month per client. I spend about 8 hours setting it up. I charge $2,500 for setup and $250 per month. That includes my ongoing maintenance and support.”

That’s honest. You can evaluate whether that’s fair. When someone won’t break down their costs, they’re usually hiding enormous margins.

Red Flag #4: They Can’t Explain It in Plain English

“We leverage proprietary multi-modal transformer architectures with retrieval-augmented generation pipelines to optimize your customer engagement funnel.”

That sentence means almost nothing. And the person who said it may not even know that.

Here’s the plain English version: “We built a chatbot that reads your website and FAQ so it can answer customer questions.”

If someone can’t explain what they’re building for you in language you’d use at dinner with your spouse, they either don’t understand it themselves or they’re trying to intimidate you into not asking questions. Both are bad.

Red Flag #5: They Promise “Set It and Forget It”

This is the biggest lie in AI right now. No AI system is set-and-forget.

AI makes mistakes. It will sometimes say wrong things to your customers. It will

occasionally do something bizarre that no one predicted. It needs monitoring, updating, and adjustment — especially in the first few months.

Anyone who tells you they'll "install AI" and you'll never need to think about it again is either lying or setting you up for a very bad surprise.

The honest version: "We'll set this up, test it, and monitor it closely for the first 30 days. After that, we'll check in monthly and you'll have a dashboard where you can see what it's doing. Things will go wrong sometimes — we'll fix them quickly."

That's trustworthy. "Set it and forget it" is not.

The Opportunity Is Real

I don't want this chapter to scare you away from AI entirely. That would be just as wrong as the hype.

The truth is: AI genuinely can save most small businesses 5-10 hours per week on tasks that are tedious, repetitive, and don't require your specific expertise. For some businesses — especially those that answer a lot of phone calls or produce a lot of written content — the savings can be much more.

The technology is real. The tools work. Many of them are free or cheap. And you can learn to use most of them yourself, without hiring anyone.

That's what the rest of this book is about. Not how to hire an AI consultant. How to become your own.

Let's start with what AI actually is.

Chapter 2: What AI Actually Is (In Plain English)

Let me save you some time. If you've been reading headlines about artificial intelligence and feeling like you missed a memo that everyone else got, you didn't. Most of the people writing those headlines don't understand it either. They just have louder megaphones.

I build AI systems. I work with them every day. And I'm going to tell you what this stuff actually is, what it actually does, and — just as important — what it doesn't do. No hype. No breathless predictions about robots taking over Main Street. Just the plain truth, which turns out to be both less exciting and more useful than what you've been hearing.

It's Not a Brain. It's Not Magic. It's Pattern Matching.

Here's the first thing to understand: AI is not intelligent. Not in the way you and I are intelligent. Not in the way your dog is intelligent. It doesn't think. It doesn't understand. It doesn't have opinions, even though it sometimes sounds like it does.

What AI actually does is pattern matching. Very fast, very large-scale pattern matching.

Think about it this way. If I showed you the phrase "The cat sat on the ___," you'd fill in "mat" without even thinking about it. Not because you reasoned through the physics of cats and mats, but because you've seen that pattern a thousand times. You just know what word fits.

That's what AI does. Except instead of one sentence, it's doing that across billions of sentences, images, and sounds. It looks at massive amounts of text — books, websites, articles, forum posts, everything — and learns which words tend to follow which other words, which patterns tend to appear in which contexts. When you ask it a question, it's not "thinking about" the answer. It's generating the most statistically likely response based on all the patterns it absorbed during training.

That's it. That's the whole trick.

Now, the trick works surprisingly well for a lot of practical tasks. I'm not dismissing it. I use these tools every single day and they save me real time. But understanding that it's pattern matching — not thinking — is the key to using it well and not getting burned by it.

When someone tells you AI is “basically a brain,” they’re selling you something. When someone tells you it’s “just autocomplete on steroids,” they’re a lot closer to the truth. It’s very sophisticated autocomplete. The sophistication is real and useful. But it’s still autocomplete.

The Intern Analogy

Here’s the way I explain AI to other business owners in Lancaster, and it’s the analogy that seems to click best:

AI is like a really fast intern who has read everything on the internet but has zero judgment.

Sit with that for a second, because it tells you almost everything you need to know.

This intern is fast. Unbelievably fast. You can hand them a task and they’ll have a first attempt back to you in seconds. Need a draft of an email to a supplier? Done. Need a summary of a twenty-page contract? Done. Need five different versions of a social media post about your weekend sale? Done, done, done, done, done.

This intern has read everything. Every website, every book that’s been digitized, every forum post, every article. They have an enormous amount of information rattling around. They can write in almost any style, on almost any topic, and sound reasonably competent doing it.

But this intern has zero judgment. They don’t know your customers. They don’t know that Mrs. Henderson has been coming in every Tuesday for eleven years and likes to chat about her grandkids before she gets to business. They don’t know that the tone you use in emails to your biggest wholesale account is different from the tone you use with walk-in retail customers. They don’t know that the last time you ran a 20%-off sale it actually hurt your margins more than it helped because your regulars would have bought at full price anyway.

They can draft. They can summarize. They can respond. But they cannot decide what matters to your customers. That’s your job. It always has been, and for the foreseeable future, it still will be.

The intern analogy also tells you how to manage AI: the same way you’d manage an eager but inexperienced intern. You give them clear instructions. You review their work before it goes out. You don’t let them make decisions on their own. And you definitely don’t put them in charge of anything where a mistake could seriously hurt your business or your reputation.

The Four Things AI Does Well Right Now

I want to be specific here, because vague promises are what got the AI hype machine rolling in the first place. These are four things that AI tools — the ones available today, not theoretical future versions — do well enough to be genuinely useful for a small business.

1. Generate First Drafts of Text

This is the big one. If your business requires you to write things — and every business does — AI can give you a solid first draft in seconds.

Emails to customers or suppliers. Social media posts. Product descriptions for your website. Job listings when you’re hiring. Follow-up messages after a sale. Thank-you notes. Responses to online reviews. Newsletter content.

Notice I said “first draft.” Not “finished product.” You still need to read it, adjust the tone, add the details that only you know, and make sure it actually sounds like you and not like a robot wearing a human suit. But starting from a draft is a whole lot faster than starting from a blank page. If you’ve ever sat staring at a cursor for twenty minutes trying to figure out how to word a tricky email to a difficult customer, you know exactly what I mean.

For a lot of Lancaster business owners I’ve talked to, this alone is worth the price of admission. Not because the AI writes better than they do — it usually doesn’t — but because it eliminates that blank-page paralysis that eats up time they don’t have.

2. Summarize and Extract Info from Large Documents

Got a forty-page vendor agreement you need to review? AI can read it and pull out the key terms, deadlines, and obligations in about ten seconds. Got a stack of customer feedback forms from the last quarter? AI can find the common themes and group them for you.

This isn't glamorous. Nobody's making TikTok videos about document summarization. But if you're a business owner who deals with contracts, lease agreements, insurance policies, employee handbooks, compliance documents, or any other long-form text that you know you should read carefully but realistically skim because you've got seventeen other things demanding your attention — this is genuinely useful.

A word of caution: AI summarization can miss things. Important things. It's a starting point for your review, not a replacement for it. If the document matters, you still need to read the parts that matter. But AI can tell you which parts those probably are, and that saves real time.

3. Answer Questions About Specific Content It's Been Given

This is different from just asking AI a random question (which can go sideways fast — more on that in a minute). When you give AI a specific document, dataset, or body of text and then ask it questions about that content, it performs surprisingly well.

You could upload your employee handbook and ask, "What does our policy say about vacation carryover?" You could paste in a long email thread and ask, "What are the three action items from this conversation?" You could give it your menu or product catalog and ask it to answer customer questions based on what you actually offer.

When AI is working with a specific, bounded set of information that you gave it, it's much more reliable than when it's just freestyling from its general training data. Think of it as the difference between asking that intern to look something up in a specific binder versus asking them to just wing it from memory. The binder version is way more trustworthy.

4. Handle Routine Phone Calls and Scheduling

This one surprises people, but AI-powered phone systems have gotten genuinely good at handling simple, routine calls. Not the kind where a customer is upset and needs a real human to listen to them. But the kind where someone calls to book an appointment, confirm business hours, check whether you have a specific item in stock, or reschedule a service call.

If you're a one-person shop or a small team, you know the pain of being with a customer in person while the phone rings. Every missed call is a potential missed sale. AI phone tools can answer those routine calls, handle the simple stuff, and pass along the calls that actually need your attention. It's not perfect. It still sounds slightly robotic to most ears. But for the caller who just needs to book a 2 PM haircut on Thursday, it gets the job done, and it's a whole lot better than voicemail.

The Four Things AI Is Terrible At

This is the section that most AI books skip, which is exactly why most AI books aren't very useful. Knowing what a tool can't do is just as important as knowing what it can.

1. Judgment Calls That Require Knowing Your Specific Customers and Community

AI doesn't know Lancaster. It doesn't know that the Fairfield County Fair is the social event of the year. It doesn't know which local suppliers are reliable and which ones talk a good game but deliver late every single time. It doesn't know that your best customer's daughter just got into Ohio State and mentioning it next time they come in would mean the world to them.

Business judgment — the real kind, the kind that keeps customers coming back and keeps you ahead of competitors — comes from years of being embedded in a specific place, serving specific people, and paying attention. AI has none of that. It can help you execute on your judgment faster, but it cannot replace the judgment itself.

If someone tells you AI can "understand your customers better than you do," they are trying to sell you software. Smile politely and change the subject.

2. Anything Where Being Wrong Has Serious Consequences

AI makes stuff up. The technical term is "hallucination," which is a fancy way of saying it confidently states things that are completely false. It does this because, remember, it's pattern matching. It generates the response that statistically seems like it should come next. Sometimes what seems like it should come next is wrong.

For low-stakes tasks, this is fine. If AI drafts a social media post and gets a detail slightly off, you catch it when you review the draft and fix it. No harm done.

But for anything legal, medical, financial, or regulatory? No. Absolutely not. Do not use AI to interpret tax law for your business. Do not use it to draft legal contracts without a lawyer reviewing them. Do not use it to give health-related advice if you're in any kind of wellness or food service business. Do not use it to make financial decisions.

I'm not saying AI can never touch these areas. I'm saying it cannot be the final word. If you use AI to draft a contract, your lawyer still needs to review it. If you use AI to help organize your bookkeeping questions, your accountant still needs to check the answers. The cost of being wrong in these areas is too high to trust a pattern-matching system that sometimes hallucinates with confidence.

I track my own predictions publicly. My accuracy rate is about 42%. I publish the misses right alongside the hits. AI doesn't even track its own accuracy, let alone publish it. Keep that in mind.

3. Replacing Relationships and Trust

Your customers come back because of you. Because of the way you greet them. Because you remember what they ordered last time. Because when something went wrong, you made it right without them having to fight for it. Because you're part of this community and they trust you.

AI cannot replicate that. It can help you be more efficient so you have more time and energy for those relationships. That's a real benefit. But the moment you try to use AI to replace the human connection that makes your business what it is, you're going to lose something you can't get back.

I've seen businesses — mostly bigger ones, but some small ones too — go all-in on AI-powered customer interaction and watch their repeat business drop. Customers aren't stupid. They can tell when they're talking to a machine, and they can tell when a business has stopped caring enough to show up personally. Efficiency is great. But efficiency without humanity is just a faster way to lose customers.

Use AI to handle the stuff that doesn't need a personal touch so that you have more energy for the stuff that does. That's the sweet spot.

4. Working Without Human Oversight

"Set it and forget it" is a marketing pitch, not a reality. Not with current AI.

Every AI tool needs a human checking its work. Every single one. The businesses that get in trouble with AI are the ones that turn it on, walk away, and assume it's handling everything correctly. It's not. It's an intern, remember? A fast, well-read intern with no judgment. You wouldn't leave a real intern unsupervised to run your business. Don't do it with an AI intern either.

This doesn't mean AI is useless. It means you need to build review into your process. AI drafts the email, you read it before it goes out. AI answers the phone call, you review the log at the end of the day. AI summarizes the document, you skim the summary against the original to make sure nothing critical got missed.

The overhead of review is real, but it's a lot less than doing everything from scratch. That's the actual, honest value proposition of AI for a small business right now: not "it does everything for you" but "it does the first 70% and you handle the last 30%." That's still a big time savings. It's just not the miracle that the sales pitches promise.

The Cost Reality

Let's talk money, because this is where a lot of small business owners get scared off before they even start.

If you've seen enterprise AI platforms advertising five-figure annual contracts, or consultants quoting $5,000 and up to "implement an AI strategy" for your business — forget all of that. That's not what we're talking about here.

The AI tools that are most useful for a small business right now cost somewhere between zero and a hundred dollars a month. Many of the best ones have free tiers that are more than enough to get started.

ChatGPT, which is the most well-known AI tool, has a free version. The paid version is $20 a month. Google's Gemini has a free version. Microsoft's Copilot has a free version. Claude, which is made by Anthropic, has a free version with a paid tier at $20 a month.

AI-powered scheduling tools, phone answering services, and email assistants typically run $20 to $100 a month depending on volume and features. Some are less.

You do not need to spend thousands of dollars to start getting value from AI. If someone is telling you otherwise, they're selling consulting, not solutions. Start small. Start cheap. Start with the free versions. See if the tool actually helps before you spend a dime. I'll get specific about which tools to try — and which ones aren't worth your time — later in this book.

How It Actually Works (The Short Version)

You don't need to understand the engineering behind AI to use it well, any more than you need to understand internal combustion to drive a truck. But a quick sketch of what's going on under the hood might help you make better decisions about when to trust it and when not to.

AI models are built by feeding enormous amounts of text — we're talking billions of pages of books, websites, articles, code, and conversations — into a system that finds patterns in all of that text. The system learns things like: after the word "Lancaster," the word "Ohio" appears a lot more often than the word "submarine." It builds up a massive, complicated web of statistical relationships between words, phrases, concepts, and structures. This process is called training, and it costs millions of dollars, which is why only big companies build the base models. But using the finished model costs pennies per interaction, which is why you can access it for $20 a month or even free.

When you type something into ChatGPT or any other AI tool — that's called a "prompt" — the model uses all those learned patterns to generate a response, one word at a time, each word chosen because it's statistically the best fit given everything that came before it. The better your prompt, the better the patterns it can match, and the more useful the response. This is why you'll hear people talk about "prompt engineering," which is really just a fancy term for "learning how to ask clearly." You already know how to give clear instructions to employees and vendors. Same skill, different tool. That's really all there is to it.

So What Does This Mean for You?

Here's the bottom line.

AI is a tool. A genuinely useful one, within its limits. It's not going to replace you, and anyone who tells you it will is either misinformed or trying to scare you into buying something. It's also not a fad that you can safely ignore. It's going to keep getting better, keep getting cheaper, and keep showing up in more of the tools and platforms you already use.

The businesses that do best with AI won't be the ones that adopt it the fastest or spend the most money on it. They'll be the ones that understand what it's actually good at, use it for those things, and keep doing everything else the way they've always done it — with real human attention, real relationships, and real judgment.

You don't need to become a tech expert. You don't need to hire a consultant. You don't need to "transform your business with AI." You need to figure out which two or three tasks eat up your time without adding much value, point AI at those tasks, and keep your focus on the things that only you can do.

That's it. That's the whole strategy. Everything else is details, and we'll get to the details.

Now that you know what AI actually is, let's talk about what you can do with it starting tomorrow morning.

Part Two: The Monday Morning Playbook

Chapter 3: The Free Tools You Should Be Using Today

You don't need to spend money to start using AI in your business. I want to be clear about that upfront, because there's a whole industry of people who would love to sell you a $49/month subscription before you even know what you're subscribing to.

The tools in this chapter are free. Actually free — not "free for 7 days and then we charge your card" free. Each one has a free tier that is genuinely useful for a small business. Some of them have paid upgrades that might be worth it down the road, and I'll tell you what those cost too. But you can do real work with the free versions, starting today.

I'm going to walk through six tools. For each one, I'll tell you what it costs, what it's good for, what will trip you up, and one thing you can try right now. Not tomorrow. Not after you "do more research." Right now, today, in the time it takes to drink a cup of coffee.

Let's go.

ChatGPT: Your New First Draft Machine

What it is: ChatGPT is the one you've heard of. It's made by a company called OpenAI, and it's the tool that kicked off this whole AI moment. You talk to it like you're texting someone, and it writes back.

What it costs: Free. You go to chat.openai.com, make an account with your email, and start typing. That's it. The free tier uses a model that's slightly older than the cutting-edge version, but for most small business tasks, you will not notice the difference. The paid version (ChatGPT Plus) is $20/month and gives you faster responses, access to the newest model, and some image generation features. You don't need it yet.

What it's actually good for:

Drafting. Brainstorming. Rewriting things you've already written.

Let me be specific. Say you need to write a description for a new service you're offering. You've been staring at a blank screen for twenty minutes. That's where ChatGPT shines. You give it the rough idea, and it gives you a first draft. The first draft won't be perfect — it'll sound a little generic, a little too polished, maybe a little too enthusiastic. But it's not a blank screen anymore. You can edit a draft. You can't edit nothing.

It's also good for brainstorming. Need ten ideas for a summer promotion? Ask it. Need five different ways to word a policy for your employee handbook? Ask it. You'll throw out half of what it gives you, and that's fine. The point is to get unstuck.

And rewriting — this is maybe the most underrated use. You've written an email to a difficult customer and you know it sounds too angry. Paste it in and say "rewrite this to be professional but firm." That alone is worth the five minutes it takes to sign up.

What it's NOT good for:

Facts. Math. Anything where being wrong matters.

I cannot stress this enough. ChatGPT will confidently tell you things that are completely made up. It will invent statistics. It will cite studies that don't exist. It will give you a phone number for a business that closed three years ago. It does this with the same confident tone it uses when it's right, so you can't tell the difference by how it sounds.

Do not use it to look up tax rules. Do not use it to check legal requirements. Do not use it to verify anything. Use it to *write*, not to *know*.

Example prompt for a Lancaster business:

Let's say you run a landscaping company and you need a Google Business Profile description.

> "I own a landscaping company in Lancaster, Ohio called Green Valley Landscaping. We do residential lawn care, mulching, spring and fall cleanups, and small hardscape projects like patios and retaining walls. We've been in business for 12 years and serve Fairfield County. Write me a Google Business Profile description that's friendly but professional. Keep it under 200 words."

You'll get something usable in about four seconds. Read it, change anything that doesn't sound like you, and post it.

The gotcha:

ChatGPT remembers your conversation as you go, but it does NOT remember previous conversations unless you turn on a memory feature (and even then, it's inconsistent). So if you spent twenty minutes giving it context about your business last Tuesday, it doesn't know any of that today. You'll need to give it context again each time, or keep one long conversation going for related tasks.

Also: anything you type into ChatGPT can potentially be used to train future versions of the model. Don't paste in sensitive customer data, financial information, or anything you wouldn't want a stranger to read. There's a setting to turn off training data usage — if you're going to use it regularly, go to Settings > Data Controls and toggle that off.

Try this right now:

Go to chat.openai.com. Sign up. Then type this:

> "I own a [your type of business] in Lancaster, Ohio. Write me three different social media posts I could use this week. Make them casual and friendly, not salesy."

Read what comes back. Edit it into something that sounds like you. Post one of them. You just saved yourself thirty minutes of staring at your phone trying to think of something to post.

Claude: The Careful One

What it is: Claude is made by a company called Anthropic. It's the same basic idea as ChatGPT — you type, it writes back — but it has a different personality. If ChatGPT is the enthusiastic new employee who's eager to help, Claude is the thoughtful one who reads the whole email before responding.

What it costs: Free at claude.ai. Sign up with your email or Google account. The free tier gives you a generous amount of usage per day. The paid version (Claude Pro) is $20/month and gives you significantly more usage and access to the most powerful model. Again, start free.

What it's good for:

Longer, more complex tasks. If you need to take a five-page lease agreement and summarize the key points, Claude tends to be more thorough and careful about it than ChatGPT. If you need to give it complicated instructions — "rewrite this but keep the tone formal in the first paragraph, casual in the second, and include a call to action at the end that mentions our Saturday hours" — Claude tends to follow multi-step instructions more reliably.

Claude is also good when you want a more measured, less hype-y tone. ChatGPT sometimes writes like a marketing brochure even when you don't want it to. Claude tends to be a bit more restrained. For some tasks, that's exactly what you need.

I'd also reach for Claude when I want to think through a business decision. Not because it will make the decision for you — it won't, and it shouldn't — but because it's genuinely good at helping you think through pros and cons, surface things you haven't considered, and organize your own thinking.

Example prompt for a Lancaster business:

Say you're thinking about extending your store hours on Thursdays to capture the evening crowd.

> "I own a retail shop in downtown Lancaster, Ohio. I'm thinking about extending my hours from 6pm to 8pm on Thursdays. Currently my busiest hours are 11am-2pm on weekdays and Saturday mornings. I have two part-time employees. Help me think through the pros and cons of this decision. What should I consider that I might not have thought of? Be honest — don't just tell me it's a great idea."

Claude will give you a genuinely useful framework for thinking it through. It might mention staffing costs, the Farmer's Market traffic pattern on certain evenings, the importance of testing it for a set period before committing, and the need to actually market the extended hours so people know about them.

The gotcha:

Claude's free tier has daily usage limits. If you're in the middle of a big project — say, rewriting your entire employee handbook — you might hit the limit partway through. This is annoying but not a dealbreaker. You can pick it up the next day, or you can switch to ChatGPT to finish. Having accounts on both is free, so there's no reason not to.

Also, like ChatGPT, Claude can be wrong about facts. It's generally a bit more cautious — it's more likely to say "I'm not sure about this" rather than confidently making something up — but it's still an AI. Verify anything that matters.

Try this right now:

Go to claude.ai. Sign up. Then paste in something you've already written — an About page, a customer email, a job posting — and type:

> "Here's something I wrote for my business. Tell me honestly: what's unclear, what's too long, and what could be better? Don't be nice about it — be useful."

The feedback you get will be surprisingly specific and genuinely helpful.

Google Gemini: The One That's Already in Your Stuff

What it is: Gemini is Google's AI. If you have a Google account — and if you use Gmail or Google Docs for your business, you do — then you already have access to it. You can use it at gemini.google.com, or increasingly, it shows up right inside Google Docs, Sheets, and Gmail as a little sparkle icon or a side panel.

What it costs: Free with your Google account. The paid version (Google One AI Premium) is $19.99/month and bakes Gemini more deeply into your Google Workspace apps. The free version is where you should start.

What it's good for:

Working with things that are already in your Google ecosystem. If your business runs on Google Docs and Google Sheets — and a lot of small businesses do, because they're free — then Gemini is the most convenient AI to reach for because it's already there.

Need to write a reply to an email in Gmail? Gemini can draft one. Need to summarize a long Google Doc? Gemini can do that without you having to copy and paste anything. Need to create a basic spreadsheet? You can describe what you want in plain English.

Gemini is also decent as a general-purpose AI for the same kinds of tasks ChatGPT and Claude handle — drafting, brainstorming, rewriting. It's not as strong as either of those for pure writing quality, in my experience, but it's good enough for a lot of tasks, and the convenience of having it built into tools you already use matters.

Example prompt for a Lancaster business:

Say you've got a Google Sheet with your inventory and you need to make sense of it.

Open Gemini (gemini.google.com) and type:

> "I have a Google Sheet with three columns: Product Name, Quantity in Stock, and Last Order Date. I want to add a column that flags any product where the quantity is below 10 and the last order was more than 30 days ago. Write me the formula for that, and explain it like I'm not a spreadsheet person."

Gemini will give you the formula AND explain what each part does. That's legitimately useful. We'll talk more about the spreadsheet angle in a minute.

The gotcha:

Gemini is newer to this game than ChatGPT and Claude, and it shows sometimes. It can be more inconsistent — great on one task, mediocre on the next. It also has a tendency to be aggressively helpful in ways that aren't always helpful, like giving you a much longer answer than you needed.

The bigger issue is privacy. If you use Gemini inside your Google Workspace, it has access to your emails, your documents, your calendar. That's the whole point — that's what makes it convenient. But it means you should understand that Google's AI is reading your stuff. For most small businesses, this isn't a dealbreaker (Google already processes your data for search and spam filtering), but it's worth knowing.

Try this right now:

Go to gemini.google.com while logged into your Google account. Type:

> "Write me a short, professional out-of-office reply for email. I'll be out from [date] to [date]. Keep it simple — I don't need anything cute."

Use it next time you're actually out. Done. You're now a person who uses AI.

Canva AI: Social Media Graphics Without the Headache

What it is: Canva is a design tool that's been around for years. You've maybe used it to make a flyer or a Facebook post. Recently they've added AI features that make it significantly more useful, especially for people who are not designers and don't want to become one.

What it costs: Free tier is genuinely useful. You get access to thousands of templates, basic AI image generation, and AI text suggestions. Canva Pro is $12.99/month (or $119.99/year) and gets you more templates, more AI features, brand kit tools, and the ability to resize designs for different platforms with one click. The free tier is enough to start.

What it's good for:

Making your social media posts look like a professional made them, even though you made them in eleven minutes between customers.

The AI features let you do things like: describe an image you want and have it generated, remove backgrounds from photos with one click, resize a design from Instagram square to Facebook banner automatically, and generate text for your designs.

But honestly, the biggest value is the templates. You search for "small business sale Instagram post" and you get hundreds of professionally designed templates. You swap in your text, your colors, maybe your logo, and you have something that looks real. Not homemade. Not clip-art-on-a-Word-document.

Example use case for a Lancaster business:

Say you own a bakery and you want to promote a weekend special.

Open Canva. Search templates for "bakery social media." Pick one you like. Change the text to say "This Saturday Only: Buckeye Brownies, $2 each, Lancaster location." If you have a decent phone photo of the brownies, drop it in. If not, use Canva's AI image generator — type "close-up photo of chocolate brownies with peanut butter filling on parchment paper" and it'll create something that looks reasonable.

Export. Post. That took you less time than it would take to describe what you want to a graphic designer, let alone wait for them to send a proof.

The gotcha:

The AI-generated images are getting better, but they can still look a little… off. Weird textures. Odd lighting. Hands with too many fingers if there are people in the image. Always look at the image carefully before you post it. And if you're selling a specific product, a real photo from your phone will always be more authentic than an AI-generated one. Use AI generation for backgrounds, decorative elements, or when you need a generic mood-setting image. Use your own photos for your actual products.

Also, the free tier puts Canva watermarks on some premium elements. If you design something and a little crown icon appears in the corner of a graphic element, that means it's a paid element. You'll either need to swap it for a free one or upgrade. This is annoying but manageable.

Try this right now:

Go to canva.com. Sign up (free). Click "Create a design" and choose "Instagram Post." In the templates panel, search for something relevant to your business. Pick a template, change the text to promote something you actually offer, and download it. Post it today. You just made a professional-looking graphic in less time than it takes to eat lunch.

Voice-to-Text: Turn Your Rambling Into Content

What it is: Voice-to-text tools record what you say and turn it into written text. The one I recommend is Monologue (monologue.to). It's a voice dictation app for Mac and iPhone that adapts to your writing style, your vocabulary, and your context. It doesn't just transcribe — it understands what you meant and cleans it up as you go.

What it costs: Monologue is included free with a subscription to Every (every.to), which is $20/month. I'm going to recommend Every anyway — more on that in a moment — so if you subscribe, Monologue comes with it at no extra cost.

Now, $20/month for a newsletter might sound steep. But Every isn't a typical newsletter. It's a publication that covers what real businesses are actually doing with AI — not hype pieces, not press releases, but practical reporting on what's working and what isn't. For $20/month, you get Monologue, you get a constant stream of honest AI business reporting, and you get access to other tools they build. It's the one subscription I'd recommend to any small business owner who wants to stay informed without drowning in noise.

If you don't want to pay for anything, you can use the Voice Memos app on your iPhone or the Recorder app on Android (which has built-in transcription on Pixel phones) to record yourself, then paste the transcription into ChatGPT or Claude for cleanup. This costs nothing.

What it's good for:

Here's the thing about most small business owners I've met: they can *talk* about their business better than they can *write* about it. Put a keyboard in front of them and they freeze up. Put them in a conversation and they'll explain their business beautifully for ten minutes straight.

Voice-to-text tools exploit this. Instead of trying to write a blog post, you talk about the topic for five minutes. You ramble, you go on tangents, you repeat yourself — that's fine. Then you take that transcription and paste it into ChatGPT or Claude with a prompt like:

> "Here's a transcription of me talking about [topic]. Turn this into a blog post of about 500 words. Keep my voice and my personality — don't make it sound corporate. Clean up the rambling but keep the good stuff."

What comes back will sound like you, because it started as you. The AI just organized it and cleaned up the "ums."

This also works for meeting notes. Have Monologue running during a meeting with a contractor or a planning session with your employees. Afterward, you have a searchable transcript. Ask the AI to pull out action items and decisions. That beats scribbled notes on a legal pad that you'll lose by Thursday.

Example use case for a Lancaster business:

You own a plumbing company and you want to post helpful tips on your website (this is great for local SEO, by the way, but we'll get to that later). You know everything about preventing frozen pipes in an Ohio winter, but writing about it sounds like homework.

Instead: open Monologue on your phone (or Voice Memos if you're using the free route). Hit record. Talk for three to five minutes about what homeowners should do before the first hard freeze. Stop recording. Monologue will give you a clean transcription that already understands your technical vocabulary — it learns words like "PEX" and "shutoff valve" and "heat tape" after hearing you use them once. Then paste it into ChatGPT or Claude:

> "Here's a transcription of me talking about preventing frozen pipes. Turn it into a helpful blog post for homeowners in central Ohio. Keep it practical and friendly. I want to sound like a knowledgeable neighbor, not a textbook."

You now have a blog post. It took you less than fifteen minutes total. A content writer would've charged you $150 for the same thing, and it wouldn't have had your actual expertise in it.

The gotcha:

Transcription quality depends heavily on audio quality. If you're recording in a noisy shop or with your phone in your pocket, the transcription will be a mess. Find a quiet-ish spot, hold your phone at a normal distance, and speak at a normal pace. You don't need a recording studio, but you do need to not be standing next to a table saw.

Also, most voice-to-text tools send your audio to the cloud for processing. Monologue is built on open models, which is a plus for transparency, but your audio still goes somewhere. If you're discussing sensitive business information, customer details, or anything confidential, be aware of that. Read the privacy policy. Or just be thoughtful about what you record.

Try this right now:

Open Monologue on your phone (or Voice Memos if you're using the free route). Record yourself answering this question out loud: "What's the one thing my customers always ask

me about, and what's the answer?" Talk for two to three minutes. Then grab the transcription and paste it into ChatGPT or Claude with this prompt:

> "Turn this into a short FAQ answer I could put on my website. Keep it under 200 words and make it sound like a real person, not a corporation."

You now have website content. It took you five minutes.

Google Sheets + AI: Your Spreadsheet Just Got Smarter

What it is: This isn't a separate tool — it's using the AI tools you already have (ChatGPT, Claude, or Gemini) to help you work with spreadsheets. If the thought of writing a spreadsheet formula makes you break out in a cold sweat, this section is for you.

What it costs: Free. You're combining Google Sheets (free) with AI chatbots (free tiers).

What it's good for:

Three things: writing formulas, cleaning up messy data, and making sense of numbers.

Writing formulas: Instead of Googling "how to write a VLOOKUP" and falling down a forty-minute rabbit hole, you describe what you want in plain English to an AI:

> "I have a Google Sheet. Column A is customer names, Column B is their email addresses, Column C is the date of their last purchase. Write me a formula for Column D that says 'Follow Up' if their last purchase was more than 90 days ago, and 'Active' if it was within 90 days."

The AI will give you the exact formula. You paste it into your sheet. It works. You just did in two minutes what would've taken you half an hour of frustrated Googling.

Cleaning up data: Say you imported a customer list from somewhere and the phone numbers are in five different formats — some have dashes, some have parentheses, some have spaces, some have nothing. You can describe the problem to an AI and get a formula or a set of steps to standardize everything.

Making sense of numbers: You can paste a small data set into an AI and ask plain-English questions. "Here are my monthly sales numbers for the last year. Which months were my strongest? Is there a seasonal pattern? What should I expect for next quarter based on this?" The AI won't have magical insight, but it can spot patterns and do basic analysis faster than you can in your head.

Example use case for a Lancaster business:

You run a small retail store and you track inventory in a Google Sheet. You want to know which items haven't sold in 60 days so you can put them on clearance.

Open ChatGPT, Claude, or Gemini and type:

> "In my Google Sheet, Column A has product names, Column B has quantities, and Column C has the date of the last sale. Write me a formula that highlights the row in red if the last sale was more than 60 days ago and the quantity is greater than 5. Give me step-by-step instructions for how to set this up, including conditional formatting. Assume I know how to use a spreadsheet but I don't know advanced features."

Follow the steps. You now have a sheet that automatically flags dead inventory. Your bookkeeper would be proud.

The gotcha:

If your spreadsheet has sensitive data — customer names, email addresses, financial figures — do NOT paste the actual data into ChatGPT or Claude. Instead, describe the structure of your sheet (Column A is names, Column B is emails, etc.) or use fake sample data. The AI doesn't need your real data to write you a formula. It just needs to know the structure.

Also, always test the formula on a small sample before applying it to your whole sheet. AI-generated formulas are usually right, but "usually right" and "always right" are very different things when you're talking about your business data.

Try this right now:

Think of one spreadsheet you use regularly where you do something manually that feels repetitive. Open ChatGPT or Claude and describe what you do:

> "Every week I manually go through my spreadsheet and [describe the task]. Is there a formula or a feature in Google Sheets that could do this automatically? Explain it to me like I'm a competent adult who just doesn't know spreadsheet tricks."

You'll probably get a solution. And you'll probably be annoyed that you've been doing it manually for two years.

A Few Ground Rules for All of These

Before we move on, a handful of things that apply to every tool in this chapter:

Don't share sensitive data. I've said it for individual tools, but it bears repeating as a general rule. Customer social security numbers, credit card info, medical information, employee personnel details — none of this goes into any AI tool. Ever. Use fake data or describe the structure instead.

Verify anything that matters. If the AI tells you a tax deadline, a legal requirement, a regulation, or a statistic — verify it from an actual authoritative source before acting on it. AI tools are writing tools, not research tools.

You are the editor, not the audience. Everything these tools produce is a first draft. Read it. Change it. Make it sound like you. If you post AI-generated text without reading it, you will eventually post something embarrassing. I've seen it happen. It's not pretty.

It's okay to use more than one. ChatGPT for quick brainstorming, Claude for longer documents, Gemini for spreadsheet help, Canva for graphics. They're free. There's no rule that says you pick one and stick with it. Use whatever works best for the task in front of you.

Start with one thing. I just threw six tools at you. Don't try to use all of them this week. Pick one — whichever one solves the most annoying problem you have right now — and use it for a week. Get comfortable. Then add another. This is a slow game, and the people who win it are the ones who actually use the tools, not the ones who sign up for everything and use nothing.

What's Next

You'll notice that almost every business use case I've described eventually involves the same thing: communicating with customers. Social media posts. Website content. Follow-up messages. That's not a coincidence. Communication is where most small businesses spend a shocking amount of time, and it's where AI can save you the most hours.

And the single biggest communication time-suck for almost every business owner I've talked to? Email.

In Chapter 4, we're going to talk about email specifically — how to use AI to draft replies faster, manage the avalanche, write emails that actually get read, and stop spending your evenings catching up on your inbox. If you've ever thought "I spend half my day on email and I hate it," the next chapter is for you.

Chapter 4: Email and Communication (Save 5 Hours a Week)

Let me guess how your morning goes. You sit down with coffee, open your inbox, and stare at forty-seven emails. Some need real answers. Some need polite answers. Some need carefully worded answers because the customer is upset and you don't want to make it worse. And every single one of them needs to sound like you — not like a form letter, not like a corporation, not like a robot.

So you start typing. You delete half of it. You rewrite the opening. You second-guess the tone. Forty minutes later, you've answered three emails and your coffee is cold.

I'm not going to tell you AI will write your emails for you. It won't. Not well, anyway. What

it will do is eliminate the blank page. And if you've ever sat there with your cursor blinking, trying to figure out how to start a message to an angry customer or a flaky vendor, you already know: the blank page is where all the time goes.

The First Draft Method

Here's the entire method, and it's not complicated:

1. You tell AI what you need to say.
2. AI writes a draft.
3. You read the draft, change what needs changing, and send it.

That's it. There's no magic. The reason it saves you five hours a week is simple math. Writing from scratch takes ten minutes per email on the hard ones. Editing a draft takes three. If you handle twenty difficult emails a week — and most business owners handle more — you just got back over two hours on email alone. Add in the newsletters, the job postings, the review responses, and the follow-ups, and five hours is conservative.

But here's the part that matters: the final email still sounds like you. Because you're the one editing it. AI gives you the clay. You shape it. Nobody on the receiving end knows or cares that you didn't start from scratch. They just get a clear, professional message that addresses their concern.

This is faster than writing from scratch AND the result sounds more like you than what AI wrote. You get the best of both worlds. The speed of a machine and the voice of a human who actually knows their customers by name.

The Prompt Formula: Situation + Tone + Constraints

Every good email prompt has three parts. Memorize this structure and you can handle any message that lands in your inbox:

Situation: What happened? What's the context? **Tone:** How should this sound? Friendly? Apologetic? Firm? Casual? **Constraints:** How long? What must be included? What should be avoided?

Here's what that looks like in practice:

> "A customer emailed complaining about a late delivery. Write a response that is apologetic but honest, under 100 words, and offers a 10% discount on their next order."

That prompt takes fifteen seconds to type. The response you get back will be a solid draft — maybe 80% of the way there. You tweak a couple of words, add the customer's name, maybe mention the specific product, and hit send. Total time: two minutes instead of ten.

The more specific you are in each part of the formula, the better your draft will be. "Write a nice email" gives you garbage. "Write a warm but professional response to a longtime customer who's frustrated about a billing error, under 150 words, acknowledging the mistake and confirming the refund has been processed" gives you something you can actually use.

Drafting Customer Responses

Customer emails fall into about a dozen categories. Once you realize that, you also realize you can have a prompt ready for each one. You're not reinventing the wheel every time someone asks for a refund or wants to know your hours.

Here's my approach: keep a document — a Google Doc, a note on your phone, a sticky note on your monitor, I don't care — with your most common prompt templates. When an email comes in, grab the right template, fill in the specifics, paste it into your AI tool, and edit the draft.

It's a recipe. Recipes work.

Writing Job Descriptions That Actually Attract People

Most job descriptions read like they were written by a committee of lawyers who've never met an actual human. They're full of jargon, vague requirements, and phrases like "dynamic

self-starter" that mean nothing to anyone.

AI can help you write job postings that sound like a real person at a real business offering a real job. Here's the prompt:

> "Write a job posting for a full-time customer service representative at a small hardware store in Lancaster, Ohio. The pay is $16-$18/hour depending on experience. No degree required. We want someone friendly, reliable, and willing to learn about home improvement products. The tone should be warm and straightforward — we're a small local business, not a corporation. Keep it under 300 words. Include that we offer health insurance after 90 days and are closed on Sundays."

Notice what happened there. You told it the job, the pay, the real requirements (not the inflated ones), the tone, and the details that actually matter to applicants. You'll get back something that sounds like a neighbor telling you about an opening, not a legal document.

The trick with job postings: be honest about what the job actually is. AI can polish your words, but it can't make a boring job sound exciting without lying. And lies get you applicants who quit in two weeks.

Follow-Up Sequences: The 3-Email Follow-Up for a New Lead

Someone asks for a quote. You send it. Then… nothing. You know you should follow up, but you don't want to be pushy. So you don't. And the lead goes cold.

A three-email follow-up sequence solves this. Write it once, and you've got it forever. Here's the template:

Email 1 (2 days after the quote):

> "Write a brief, friendly follow-up email to a potential customer who received a quote from my [type of business] two days ago. Don't be pushy. Just check in, ask if they have questions, and remind them I'm happy to adjust the scope if needed. Under 75 words."

Email 2 (5 days after the quote):

> "Write a second follow-up email to a potential customer who received a quote from my [type of business] five days ago and hasn't responded to my first follow-up. Keep it casual and low-pressure. Mention one reason customers tend to choose us [insert your reason — fast turnaround, local reputation, warranty, whatever]. Under 75 words."

Email 3 (10 days after the quote):

> "Write a final follow-up email to a potential customer who received a quote from my [type of business] ten days ago. Be gracious. Let them know the quote is still good for 30 days, that there's no pressure, and that I'm here if anything changes. This is the last follow-up — make it feel like a door being left open, not a foot being jammed in it. Under 75 words."

Three emails. Spaced out. Each one gets shorter and more relaxed. I've talked to business owners who've closed 20% more quotes just by following up consistently. The hard part was never the selling — it was getting around to writing the emails. AI removes that excuse.

Responding to Google Reviews

Google reviews matter. You know this. A good response to a positive review builds loyalty. A good response to a negative review can actually win people over — not the reviewer, usually, but the fifty other people who read the exchange before deciding whether to call you.

For positive reviews:

> "Write a short, genuine response to a positive Google review for my [type of business]. The reviewer's name is [name] and they specifically praised [what they mentioned]. Thank them sincerely without being over-the-top. Don't use exclamation marks more than once. Under 50 words."

The key here: don't sound like a corporate thank-you card. Sound like a person who's actually grateful. Change a word or two so it doesn't read identically to your other review responses.

For negative reviews:

> "Write a calm, professional response to a negative Google review for my [type of business]. The reviewer is upset about [specific issue]. Acknowledge their frustration without being defensive. Apologize for their experience. Invite them to contact me directly at [phone/email] to resolve it. Don't argue or make excuses. Under 75 words."

Two rules for negative review responses: never argue in public, and always take it offline. Your response isn't really for the upset reviewer. It's for every future customer who reads it and thinks, "Okay, this owner handles problems like an adult." That's worth its weight in gold.

The Weekly Newsletter in 30 Minutes

A lot of small business owners know they should send a newsletter. Almost none of them do, because it feels like it takes forever. Here's the 30-minute method:

Minutes 1-5: Outline. Jot down three things worth mentioning this week. A new product, a seasonal tip, a local event you're involved in, a customer story (with permission), a behind-the-scenes update. Just bullet points. Don't overthink it.

Minutes 5-15: Draft. Give AI your outline and this prompt:

> "Write a short email newsletter for [business name], a [type of business] in Lancaster, Ohio. This week's topics are: [your three bullet points]. The tone should be conversational and friendly, like I'm talking to a neighbor. Keep the whole thing under 300 words. Include a brief sign-off that mentions [any call to action — visit us this weekend, book an appointment, check out the new arrivals, etc.]."

Minutes 15-25: Edit. This is the important part. Read every word. Change anything that doesn't sound like you. Add a personal detail — mention the weather, a local event, something that happened in the shop. Cut anything that feels like filler. Your customers can smell filler.

Minutes 25-30: Send. Paste it into Mailchimp or whatever you use. Hit send. Move on with your day.

Thirty minutes. Once a week. That's a newsletter that keeps you in people's inboxes and top of mind. Perfect is the enemy of sent. Send the thing.

The 10 Copy-Paste Prompts

Here they are. The ten most common business emails, with prompts you can copy, paste, fill in the blanks, and use today. I'd suggest saving these somewhere you can grab them fast.

1. Customer Complaint Response

> "A customer named [name] emailed complaining about [specific issue]. Write a response that is apologetic and understanding, acknowledges the problem without making excuses, and offers [specific resolution — refund, discount, replacement, etc.]. Keep it under 100 words. Tone: warm but professional."

2. Quote/Estimate Follow-Up

> "Write a follow-up email to [name] who received a quote from my [type of business] for [service/product] [number] days ago. Check in to see if they have questions. Be friendly, not pushy. Mention that I'm happy to adjust the quote if their needs have changed. Under 75 words."

3. Appointment Reminder

> "Write a friendly appointment reminder email to [name] for their [type of appointment] at [business name] on [date] at [time]. Include the address: [address]. Mention our cancellation policy: [policy, e.g., 'please give us 24 hours notice if you need to reschedule']. Tone: friendly and helpful. Under 75 words."

4. New Customer Welcome

> “Write a welcome email for a new customer at [business name], a [type of business] in Lancaster, Ohio. Thank them for choosing us. Briefly mention one or two things that make us different [insert: e.g., family-owned for 20 years, free estimates, satisfaction guarantee]. Invite them to reach out if they ever need anything. Under 100 words. Tone: warm and genuine, not salesy.”

5. Vendor Negotiation

> “Write a professional email to a vendor at [company name] requesting a better price on [product/service]. We’ve been ordering from them for [time period] and our volume has increased. I want to ask for a [specific request — percentage discount, free shipping, better payment terms] without being aggressive. Tone: respectful and businesslike. Under 150 words.”

6. Job Posting

> “Write a job posting for a [position] at [business name], a [type of business] in Lancaster, Ohio. Pay: [range]. Hours: [schedule]. Requirements: [list real requirements, not wish-list items]. Benefits: [list what you actually offer]. The tone should be straightforward and welcoming — we’re a small local business looking for a good person, not a perfect resume. Under 250 words.”

7. Employee Policy Update

> “Write an email to my team of [number] employees announcing a change in our [specific policy — PTO, scheduling, dress code, etc.]. The change is: [describe the change]. The reason is: [brief honest reason]. It takes effect on [date]. Tone: clear and respectful. Acknowledge that change can be annoying but explain why this is happening. Under 150 words.”

8. Holiday Hours Announcement

> “Write an email to our customer list announcing our holiday hours. [Business name] will be [open/closed] on [dates] and will return to normal hours on [date]. Tone: cheerful but brief. Wish them a happy [holiday]. Mention that they can [leave a message, email us, book online] while we’re closed. Under 100 words.”

9. Referral Request

> “Write an email to a satisfied customer named [name] asking if they’d be willing to refer us to friends or family. We recently [completed a project for them, served them, etc.] and they seemed happy with the result. Don’t be awkward about it — just be honest that referrals are the best way our small business grows. If we offer a referral incentive, mention it: [incentive, e.g., $25 off their next visit]. Under 100 words. Tone: grateful and straightforward.”

10. Thank You / Review Request

> “Write a thank-you email to a customer named [name] who recently [purchased something, used our service, completed a project with us]. Express genuine appreciation. Then ask if they’d be willing to leave us a Google review — include the link: [your Google review link]. Don’t be pushy about the review. Make the thank-you the main point. Under 100 words.”

There they are. Ten prompts. Print this section out if you want. Tape it to the wall next to your computer. The goal is that the next time you stare at an email and think, “Ugh, I have to figure out how to word this,” you don’t have to figure out anything. You grab the template, fill in the details, get a draft, and edit it.

The Big Warning (Read This Part Twice)

I need to be direct with you about something, and I’m going to put it bluntly because it’s important:

Always read what AI writes before you send it.

Always. Every time. No exceptions. I don’t care if you’re in a rush. I don’t care if the first

five drafts were perfect. Read number six too.

Here's why. AI will sometimes:

- **Get facts wrong.** It might say your store is open on Sunday when it isn't. It might reference a 10% discount you never offered. It might say "as we discussed on the phone" when you've never spoken to this person. These mistakes range from embarrassing to expensive.
- **Say something weird.** AI can produce sentences that are technically correct but sound off. Odd word choices. Phrasing that no human in Lancaster would ever use. A level of formality that doesn't match your business. You'll catch it instantly when you read it — but you have to read it.
- **Miss your voice entirely.** AI doesn't know that you always sign off with "Take care" instead of "Best regards." It doesn't know you call your customers by their first name. It doesn't know your sense of humor. These are the details that make your communication yours, and only you can add them.
- **Be too agreeable.** This is a subtle one. AI tends to over-apologize, over-promise, and say yes to everything. If a customer complaint isn't actually your fault, AI might write a groveling apology that implies liability you don't have. Read carefully. Edit accordingly.

The draft saves you time. The editing is non-negotiable. Think of it like a spell-checker. You wouldn't send an important email without glancing at the red squiggly lines. Same principle, bigger stakes.

I've heard a story about a business owner who let AI auto-respond to a customer complaint without reading the draft first. The AI offered a full refund on a $3,000 job for what was essentially a minor cosmetic issue. Could've been resolved with a thirty-minute callback. Instead it cost thousands because nobody read the draft. Don't be that person.

The Tool That Does Half of This For You

Everything I've described so far is manual. You open ChatGPT, paste the prompt, get the draft, edit it, send it. And that works great. It's free and it's effective.

But there's a tool that automates a big chunk of this workflow, and I'd be doing you a disservice not to mention it.

It's called Cora (cora.computer), and it's an AI email assistant that lives inside your inbox. Here's what it does:

It screens your email. Cora learns what's important to you — which emails need your attention and which ones don't. Important messages stay in your inbox. Everything else gets sorted automatically.

It summarizes the rest. Twice a day, Cora sends you a "Brief" — a clean summary of everything you received that doesn't need a reply. Newsletters, notifications, updates, CC'd threads. Instead of opening forty-seven emails to figure out which three actually matter, you read the Brief in thirty seconds and move on.

It drafts responses in your voice. This is the part that connects to everything we've been talking about. Cora reads your email history and learns how you write. When it has enough context, it drafts responses that sound like you — not like a template, not like a robot. You review, edit if needed, and send.

It can't send or delete emails. This matters. Cora doesn't have permission to send anything on your behalf or delete anything from your inbox. It drafts. You decide. That's the right level of automation for something as important as business communication.

Here's the part that makes it easy to recommend: Cora is included in the Every subscription I mentioned in Chapter 3. Same $20/month that gets you Monologue (voice dictation) also gets you Cora (email management) and access to Every's reporting on what real businesses are doing with AI.

So for $20/month, you get a voice-to-text tool that learns your vocabulary, an email assistant that learns your voice, and a steady stream of honest AI business reporting. That's genuine value — not a pitch, just math.

Is Cora necessary? No. The manual approach I described in this chapter works fine. But if email is eating two hours of your day and $20/month would cut that to thirty minutes, the math does itself.

Putting It All Together

Here's what your week looks like after you've got this system down:

Monday morning: open your inbox. Grab the right prompt template for each email that needs a real response. Generate drafts. Edit. Send. What used to take an hour takes twenty minutes.

Tuesday: a new Google review comes in. You grab the review response prompt, tweak the draft, and reply within the hour. The customer feels seen. Future customers see a responsive business.

Wednesday: you need to send the weekly newsletter. Thirty minutes, start to finish. Outline, draft, edit, send. Done before lunch.

Thursday: you realize you need to hire a part-time person for the summer. Instead of putting it off for two weeks because writing job descriptions is tedious, you grab the prompt, generate a posting, edit it, and have it up on Indeed by noon.

Friday: a lead from last week never got back to you on a quote. Follow-up email goes out in three minutes.

None of this is revolutionary. None of it requires expensive software or a computer science degree. It's just a system. Templates, drafts, editing, sending. The AI does the tedious part. You do the human part. And your week gets a little bit lighter.

That's five hours back. Minimum. Use them however you want — I'd suggest spending at least some of that time actually talking to customers face-to-face. That's the one thing AI will never be better at than you.

Chapter 5: Marketing Without a Marketing Department

You know when you're supposed to be doing marketing? It's 9:47 PM on a Tuesday. The shop's been closed for three hours. You've eaten dinner, helped with homework, and now you're sitting on the couch with your phone, thinking you should probably post something on Facebook because you haven't posted in two weeks.

So you take a picture of… what? The front of your store? Again? You type something like "Come see us this weekend!" and stare at it for thirty seconds before deciding it's stupid and closing the app.

That's marketing for most small businesses in Lancaster. It's not a department. It's not even a job. It's a guilt-ridden afterthought squeezed between everything else you actually have to do.

I'm not going to tell you AI will fix this. It won't give you a marketing department. What it will do is make you roughly three times more effective in the time you're already spending — which, if we're honest, isn't much time. Three times almost-nothing is still not a lot, but it's enough to actually move the needle.

Let's get practical.

Social Media Posts From Your Phone

Here's the method that actually works: batch your content. Instead of trying to think of something clever every few days (and failing), sit down once a week for one hour and generate five to seven posts at once. Schedule them. Forget about them. Move on with your life.

One hour. That's it. And with AI doing the heavy lifting on the writing, most of that hour is you deciding what to talk about, not how to say it.

The Batch Content Method

Pick the same time every week. Sunday evening, Monday morning, whatever works. Then:

1. Jot down three to five things that happened in your business this week, or that are coming up next week. A new product came in. A customer said something nice. You're changing

hours for a holiday. You learned something interesting about your industry. Just bullet points.

2. Feed those bullet points to AI with a prompt tailored to each platform.
3. Review what comes back. Edit it. Add a personal detail. Schedule it.

That's the whole system.

Platform-Specific Prompts

Each platform has a different vibe, and your prompts should reflect that. Here are templates you can copy and modify:

For Facebook (where your local customers actually are):

> I own [type of business] in Lancaster, Ohio. Write a Facebook post about [topic]. Keep it conversational, like I'm talking to a neighbor. Two to three sentences max. Include a question at the end to encourage comments. Don't use hashtags. Don't use exclamation points in every sentence.

For Instagram (when you have a photo to go with it):

> Write an Instagram caption for a photo of [describe the photo]. I own [type of business] in Lancaster, Ohio. Keep it short — two to three sentences. Add 5 relevant hashtags at the end, including #LancasterOhio and #FairfieldCounty. Sound like a real person, not a brand.

For Google Business Profile (this one's about search):

> Write a Google Business update for my [type of business] in Lancaster, Ohio. Topic: [topic]. Keep it under 100 words. Include the phrase "[your business type] in Lancaster" naturally. Focus on what a customer searching for this service would want to know.

Notice what these prompts have in common: they all tell the AI to sound like a person, they set length limits, and they specify Lancaster. That last part matters more than you'd think. The AI's default mode is to write for everyone everywhere, and that's exactly what you don't want.

Quick Graphics With Canva AI

If you set up Canva in Chapter 3, you already have access to their AI tools. For social media graphics, the Magic Design feature is the fastest path. Upload a photo of your product or shop, tell it what the post is about, and it'll generate a few layout options. Pick one, change the text if needed, download it, done.

You don't need to be a designer. You need to not look like you made it in Microsoft Paint in 2006. Canva clears that bar easily.

The Authenticity Trap

Here's where I have to be honest with you, because this is where a lot of AI marketing advice goes wrong.

If you take the AI output and post it without changes, you will sound like every other business using AI to post without changes. And your customers will notice. Maybe not consciously — they won't think "this was written by ChatGPT." But they'll scroll past it, because it sounds like nothing. It's the verbal equivalent of beige.

Generic AI content hurts you more than posting nothing. Silence is neutral. Generic content actively tells your customers you don't care enough to be real.

The fix is simple: add one personal or local detail to every single post.

Not "We love serving our community!" That's generic. Instead: "The fog rolling off the Hocking River this morning made the whole shop smell like autumn. Good day for a hot coffee." That's specific. That's Lancaster. Nobody's scrolling past that.

When AI gives you a draft, your one job is to add the detail that makes it yours. Mention a street. Reference the weather. Talk about the guy who comes in every Thursday. Whatever is true and specific to your actual life in your actual business in your actual town.

The AI builds the frame. You hang the picture.

Google Business Profile Optimization

Pull up your Google Business Profile right now. Seriously. Go to business.google.com and look at it.

If you're like most Lancaster businesses I've looked at, here's what I'll see: your name, your address, your hours (which might be wrong), and a business description that's either blank or one sentence long. Maybe a few photos from 2019.

This is free real estate. Google Business Profile is the single most important piece of online marketing for a local business, and most people treat it like a form they filled out once and forgot about.

Your Business Description

You get 750 characters for your business description. That's not much — maybe four or five sentences. AI is perfect for this because you need to pack a lot of information into a tight space.

Here's your prompt:

> Write a Google Business Profile description for [business name], a [type of business] in Lancaster, Ohio. We [describe what you do in plain language]. Our customers are [describe your typical customer]. Include the phrase "[business type] in Lancaster, Ohio." Keep it under 750 characters. Sound professional but warm, not corporate.

Run it. Edit it. Make sure every fact is true. Post it.

Services and FAQ

Google lets you list your services and add frequently asked questions. Most businesses leave these blank. Don't.

For services, just list what you offer. AI can help you describe each one:

> Write a one-sentence description for this service offered by a [business type] in Lancaster, Ohio: [service name]. Keep it clear and simple. Include what a customer should expect.

For FAQ, think about the five questions customers actually ask you on the phone. Then:

> I own a [business type] in Lancaster, Ohio. Write a brief answer (2-3 sentences) for this frequently asked question: [question]. Be helpful and specific. Include our location or service area if relevant.

Responding to Reviews

We covered review response templates in Chapter 4, so I won't repeat all of that here. But the short version: respond to every review, positive or negative. AI can draft responses in seconds. A good prompt:

> Write a brief response to this [positive/negative] review for my [business type] in Lancaster: "[paste the review]." Thank them by name if they gave one. Keep it under three sentences. Be genuine, not salesy.

For negative reviews, always add the line about taking it offline — "Please call us at [number] so we can make this right." AI will usually include something like that, but double-check.

Photos and Captions

Here's one thing AI cannot do: take pictures of your shop. No technology on earth can replace you pulling out your phone and snapping a photo of your storefront on a nice day, your team at work, your product on the shelf, or a customer's finished project (with their permission).

Photos are the number one factor in whether someone clicks on your Google listing. More than your description. More than your reviews. People want to see what they're walking into.

Take at least two new photos a month. That's it. Then let AI write the captions:

> Write a Google Business photo caption for a picture of [describe the photo] at [business name] in Lancaster, Ohio. One sentence. Natural tone.

Simple. But most businesses don't do it, which means doing it puts you ahead.

Writing Your 'About Us' Page

Go look at your website's About page. If you have one, there's a decent chance it starts with "Founded in [year], [Business Name] has been proudly serving the Lancaster community…" and then says essentially nothing else.

Or maybe you don't have one at all.

Either way, we're going to fix it in about twenty minutes. Here's the method:

1. Open the voice memo app on your phone.
2. Talk for two minutes about your business. Why you started it. What you do. Who your customers are. What you care about. Don't think too hard. Just talk like you're explaining your business to someone at a cookout.
3. Transcribe it. You can use your phone's built-in transcription, or paste the audio into ChatGPT and ask for a transcript.
4. Feed the transcript to AI with this prompt:

> Here's a rough transcript of me talking about my business. Rewrite this as an 'About Us' page for my website. Keep my voice and personality — don't make it sound corporate. About 200-300 words. Include what we do, why we do it, and who we serve. Keep it warm and real.

Let me show you what this looks like with a real example.

Before: The Voice Memo Transcript

"So yeah, we've been doing HVAC work for, I don't know, my dad started it in like '94 and I took it over when he retired. We do furnaces, air conditioning, all that. Mostly residential but we do some commercial stuff too, like small offices and things. Um, we're out in Lancaster but we go all over Fairfield County, sometimes out to Pickaway County too. I think what makes us different is we actually show up when we say we're going to, which sounds like a low bar but honestly in this industry that's not nothing. We've got four guys on the team now. Good guys. We don't try to upsell people on stuff they don't need, which — I've heard some stories from customers about other companies and it makes me mad, honestly."

After: The AI-Polished About Page

"Mitchell Heating & Cooling has been keeping Lancaster homes comfortable since 1994, when Dave Mitchell started the business out of his garage on Cherry Street. His son Brian took over in 2018, but the approach hasn't changed: show up when you say you will, fix the problem, and don't sell people things they don't need.

We handle furnaces, air conditioning, heat pumps, and duct work for homes and small businesses across Fairfield County and into Pickaway County. Our four-person team has over 40 years of combined experience, and we still answer our own phone.

We know that when your furnace goes out in January, you don't need a sales pitch. You need someone at your door who knows what they're doing. That's what we do."

See what happened there? The AI took the rambling voice memo and made it clean, but it kept the personality. Brian's annoyance about upselling became "don't sell people things they don't need." The pride about showing up on time stayed in. It sounds like a real person runs this business, because a real person does.

One pass of editing. Twenty minutes total. And now you have an About page that actually makes someone want to call you.

Monthly Newsletter in 30 Minutes

I know what you're thinking. "I can barely keep up with Facebook. Now you want me to send a newsletter?"

Yes. And here's why: you own your email list. Facebook can change their algorithm tomorrow and your posts stop reaching people. Instagram can decide your content violates some rule you've never heard of. Google can tweak their search results and your listing drops.

Your email list is yours. Nobody can take it away or throttle it. When you send an email, it lands in an inbox. Maybe they read it, maybe they don't. But it gets there.

And here's the thing — a monthly newsletter is not hard if you use a structure. Same structure every month. Four sections. AI writes the first draft of each one from bullet points you provide.

The Structure

Section 1: Business Update (what's new) What happened this month? New product? New team member? New hours? Expansion? Holiday schedule? Give AI three bullet points and let it write two paragraphs.

Section 2: One Useful Tip (teach something) Share one thing your customers would find useful. A plumber might share a tip about preventing frozen pipes. A bakery might share how to store bread. A mechanic might explain what that dashboard light means. This is the section people will actually forward to friends.

Section 3: One Offer (sell something) You're allowed to sell. One offer per newsletter. A discount, a new service, a seasonal special. Keep it simple. One thing, one call to action.

Section 4: Personal Note (be human) Two to three sentences about something going on in your life or the community. Your kid's soccer season. The Fairfield County Fair coming up. That new restaurant downtown. This is the section that makes people remember you're a person.

The Prompt

> I need to write my monthly newsletter for [business name], a [business type] in Lancaster, Ohio. Here are my notes for each section:
>
> Business update: [your bullet points] Useful tip: [your bullet points] Monthly offer: [your bullet points] Personal note: [your bullet points]
>
> Write a short, friendly newsletter with these four sections. Each section should be 2-3 sentences. Total length under 400 words. Use a conversational tone. Subject line should be short and specific, not clickbaity.

You'll get a draft back in about thirty seconds. Read through it, change anything that sounds off, add a detail or two that's genuinely yours, and hit send.

Free Tools to Send It

You don't need to spend money on this:

- **Mailchimp Free Tier:** Up to 500 contacts, 1,000 sends per month. Plenty for most local businesses. Straightforward to set up. Has templates so you don't have to design anything.
- **Beehiiv Free Tier:** Up to 2,500 subscribers. Cleaner interface, more modern design. A little more setup but worth it if you plan to grow the list.

Either one works. Pick whichever one you find less annoying. The tool doesn't matter. Sending the email matters.

When AI-Generated Content Hurts You

I've spent this whole chapter telling you how AI can help with marketing. Now I need to tell you when it does the opposite.

Generic Posts That Could Be From Anywhere

"We're passionate about providing quality service to our valued customers! Stop by today and experience the difference!"

That could be a post from any business in any town on earth. It says absolutely nothing. It

contains zero information. If you remove your business name from it and there's no way to tell who wrote it, it's garbage. Don't post it.

Obvious AI Writing

AI has tells. Words and phrases it uses constantly that normal humans almost never use in casual conversation:

- "Delve into"
- "It's important to note that"
- "In today's fast-paced world"
- "Whether you're a… or a…"
- "Let's explore"
- "At the end of the day"
- "We pride ourselves on"
- Any sentence that starts with "Navigating"

If you see these in your AI-generated content, edit them out. Not because there's something wrong with AI writing per se, but because your customers can spot it, and it makes you look like you couldn't be bothered to write your own stuff. Which, fair, you couldn't. But they don't need to know that.

Posting Too Much

There's a weird thing that happens when content becomes easy to create: people start creating too much of it. Suddenly you're posting every day because you can, not because you should.

For most local businesses, two to three posts per week on Facebook is plenty. One or two on Instagram. A Google Business update once or twice a month. A newsletter once a month.

More than that and you're just noise. Your customers follow you because they buy from you, not because they want a content feed. Respect that.

The Rule

Here's the simplest test for any piece of content you're about to post:

Would you say this to a customer standing in your shop?

If a regular walked in and you said "We're passionate about leveraging quality solutions to enhance your experience," they'd look at you like you'd lost your mind. So don't post it either.

If you'd say "Hey, just got in a new shipment of that dark roast you liked — swing by this week before it's gone," then yeah, post that. It sounds like you. Because it is you.

What This Actually Looks Like

Let me put this all together with a realistic scenario.

Say you own a hardware store on Main Street. Here's your weekly marketing routine:

Sunday evening, 45 minutes: - Open AI on your phone - Type in three things that happened this week: you got a new line of garden tools, a customer built a deck using lumber from your store, and you're closing early Wednesday for your daughter's graduation - Generate five posts: two for Facebook, two for Instagram, one Google Business update - Add a personal detail to each one — mention the customer's name (with permission), reference the weather, note that the garden tools are from an Ohio company - Schedule them in Facebook and Instagram's built-in schedulers - Post the Google Business update directly

First of the month, 30 minutes: - Jot bullet points for your newsletter's four sections - Run the newsletter prompt through AI - Edit the draft, add your voice - Send through Mailchimp

Quarterly, 20 minutes: - Review your Google Business Profile - Update photos, hours, services if anything changed - Check that your description still reflects what you do

Total time: about an hour a week, plus a half-hour once a month. That's it. That's your entire marketing operation.

It's not a marketing department. But it's a heck of a lot better than posting a blurry photo of your storefront at 9:47 PM on a Tuesday and hoping for the best.

Chapter 6 will cover customer service — how to use AI to respond faster without sounding like a robot.

Chapter 6: Operations — The Boring Stuff That Makes You Money

Nobody posts about operations on LinkedIn.

Nobody goes to a networking event and brags about how they finally standardized their estimate templates. Nobody records a TikTok about writing an employee onboarding checklist. There's no viral thread about cleaning up a customer spreadsheet.

And that's exactly why operations is where AI delivers the most value for small businesses.

The previous chapters talked about marketing, social media, content — the stuff that gets attention. This chapter is about the stuff that doesn't get attention. The back-office work. The paperwork. The procedures that live in your head. The fifteen hours a week you spend on tasks that don't directly make you money but that the business falls apart without.

This is the boring chapter. It might also be the most profitable one.

The Case for Boring

Here's a pattern I see constantly in Lancaster. A business owner spends two hours writing an estimate because they're formatting it from scratch every time. They spend another hour answering the same customer questions they answered yesterday. They can't take a day off because nobody else knows how to open the shop. They've got customer information scattered across three spreadsheets, a notebook, and a stack of Post-it notes on the monitor.

None of this is a crisis. It's all just friction. Small inefficiencies that add up to a massive tax on your time.

And here's the thing about AI that the hype machine doesn't emphasize enough: AI is exceptionally good at boring work. Taking messy information and making it clean. Taking spoken explanations and turning them into written procedures. Taking repetitive questions and organizing them into useful documents.

It's not glamorous. But it's real. And unlike some of the marketing applications where results vary, operations improvements tend to stick. You fix your estimate template once, and it's fixed. You write an SOP once, and it exists. These are permanent upgrades to your business.

Let's get into it.

Invoice and Estimate Templates

I want you to pull up the last estimate or invoice you sent to a customer. Look at it honestly. Does it look professional? Is it consistent with the one you sent last week? Does it include everything it legally should?

For a lot of small businesses, the answer to at least one of those questions is no. And I'm not judging — when you're busy running a business, making the estimate look pretty is about priority number forty-seven. You type up the numbers, send it out, and move on.

But here's what a messy estimate actually costs you. It costs you credibility. When a customer is comparing your estimate to one from a competitor that looks clean and organized, yours starts at a disadvantage. It costs you time, because you're reformatting things every single time instead of filling in a template. And it might cost you legally, because Ohio has specific requirements about what needs to appear on certain business documents, and if you're winging it, you might be missing something.

AI can fix this in about ten minutes.

Take your current estimate — however ugly it is — and paste it into ChatGPT, Claude, or whatever tool you're using. Then use a prompt like this:

> "Here is my current estimate format [paste it]. Rewrite it to look professional, include

> all legally required information for Ohio, and make it easy for the customer to understand. Keep it simple — my customers are homeowners, not corporations."

What you'll get back is a clean, organized template with proper sections, clear line items, and all the details that should be there — your business name and address, the customer's information, dates, itemized costs, payment terms, and any required Ohio disclosures.

You might need to adjust it. The AI doesn't know your specific industry requirements, and it doesn't know your local preferences. But it gives you a solid starting point that would have taken you an hour or more to build from scratch.

Do this once. Save the template. Use it every time. That's it. That's the whole tip. It's not revolutionary, but if you send ten estimates a month and each one takes fifteen minutes less because you're working from a real template, you just saved two and a half hours a month. Thirty hours a year. On estimates.

The same applies to invoices, receipts, contracts, and any other document you send to customers regularly. Get one good version. Templatize it. Move on.

Standard Operating Procedures: Get It Out of Your Head

This one's important, so I'm going to be direct about it.

If you are the only person who knows how to do critical tasks in your business, you do not have a business. You have a job that you can never leave.

Every small business owner I know in Lancaster has some version of this problem. The opening procedure is in their head. The process for handling a customer complaint is in their head. The steps for placing an order with their supplier is in their head. They know how everything works, and they've never written any of it down, because writing it down takes time they don't have and feels unnecessary when they're the one doing it anyway.

Then they want to hire someone. Or they get sick. Or they want to take their family to Put-in-Bay for a long weekend. And suddenly the fact that nothing is documented becomes a very real problem.

Standard Operating Procedures — SOPs — are just written instructions for how to do the things your business does. They're not complicated. They don't need to be fancy. They just need to exist.

And here's where AI helps, because the biggest barrier to creating SOPs isn't the writing — it's the extraction. Getting the knowledge out of your head and onto paper.

The Voice Memo Method

This is the simplest approach I've found, and it works for just about anyone.

Step one: Pull out your phone and open the voice recorder. Every phone has one.

Step two: Imagine you're training a new employee. Hit record and talk through the procedure. Just explain it like you're standing next to someone on their first day. "First you do this, then you check that, make sure you don't forget this part, and here's the thing that trips people up."

Step three: Transcribe the recording. If you've got Monologue (from Chapter 3), it'll handle this beautifully — it already knows your vocabulary and speaking style. Otherwise, use your phone's built-in transcription, or paste the audio into ChatGPT or Claude.

Step four: Take that transcript — which will be rambling and disorganized, because that's how people talk — and give it to AI with a prompt like this:

> "Here's a transcript of me explaining how to [open our store in the morning / process a new customer intake / handle a return]. Turn this into a clear, step-by-step standard operating procedure. Number the steps. Include any warnings or tips I mentioned. Keep it simple enough that a new employee could follow it on their first day."

What comes back will be a clean, numbered procedure that captures everything you said, organized logically, without the ums and tangents and backtracking.

Let me give you a concrete example. Say you run a retail shop on Main Street and you record yourself explaining the opening procedure. Your rambling voice memo might cover

unlocking the door, disarming the alarm, turning on the lights, checking the register, setting up the display — all the things you do automatically every morning without thinking about them.

The AI will organize that into something like:

1. Arrive at store by 8:45 AM
2. Unlock the front door, enter, and re-lock behind you
3. Disarm the security system (code is posted in the office)
4. Turn on main floor lights and display case lights
5. Power on the POS system and verify the opening cash drawer count
6. Check the voicemail for any overnight messages
7. Set up the sidewalk sign and unlock the front door at 9:00 AM

You review it, fix anything the AI got wrong, and now you have a document you can hand to anyone. Your spouse, a new hire, a friend covering for you while you're out.

Here's why this matters beyond convenience: you cannot hire help until these documents exist. You cannot take a real vacation until these documents exist. You cannot scale, grow, or eventually sell your business until these documents exist. They are the foundation of a business that works without you being physically present every minute.

Start with three SOPs. Pick the three tasks that only you know how to do and that would cause problems if you were unavailable. Record yourself explaining them. Let AI clean them up. Put them in a binder or a shared Google Drive folder. You can add more over time, but three is enough to start.

It'll take you maybe an hour total. That hour might be the highest-value hour you spend all year.

Employee Onboarding Documents

If you've ever hired someone and their first day was basically "follow me around and try to absorb everything," you know how inefficient that is. For you and for them.

A good onboarding process doesn't need to be corporate. It doesn't need a three-ring binder and an HR department. It just needs to be organized enough that a new person knows what to expect and you don't have to repeat yourself fifteen times.

AI is genuinely useful here because creating onboarding documents from scratch is tedious and most business owners never get around to it. But AI can generate a solid first draft in minutes.

Try this prompt:

> "I'm hiring a new [sales associate / receptionist / technician / whatever the role is] for my [type of business] in Lancaster, Ohio. Create a first-week onboarding checklist using a Day 1, Week 1, and Month 1 structure. Include sections for company policies, safety requirements, daily procedures, and who to ask for help. Keep it practical — this is a small business, not a corporation."

What you'll get is a structured document that covers the basics: where to park, what time to show up, what to wear, who to report to, how to use the POS or phone system, key safety information, what's expected by the end of the first week, and what full competency looks like at thirty days.

You'll need to customize it. AI doesn't know that your back door sticks and you have to jiggle the handle, or that Thursdays are your busiest day, or that your suppliers deliver on Monday mornings. But it gives you the structure, and you fill in the specifics.

The Day 1, Week 1, Month 1 framework is particularly useful because it sets expectations on both sides. The new hire knows what they should be learning and when. You know what you should be teaching and when. Nobody's guessing.

If you plan to hire even one person in the next year, build this document now, while you're not in a rush. Having it ready before you need it is the whole point.

Customer FAQ: Stop Answering the Same Questions

Here's an exercise. Think about the last two weeks of customer interactions — phone calls, emails, walk-ins, messages on Facebook. Now write down every question you were asked

more than three times.

I'll bet you can come up with ten to fifteen without much effort.

What are your hours? Do you take walk-ins? How much does [common service] cost? Do you offer payment plans? Where are you located? Is parking available? How long does [common service] take? Do I need an appointment? What's your cancellation policy? Do you serve [specific area]?

You answer these questions over and over, every week, forever. Each answer takes a minute or two. Multiply that across dozens of customers per month and you're spending real time — hours — on information that could be written down once and referenced permanently.

Take your list of frequently asked questions and feed them to AI:

> "Here are the most common questions my customers ask, along with my typical answers [paste them]. Polish these into professional, friendly FAQ responses I can put on my website, print for my waiting room, and include in email communications. Keep the tone warm but direct — we're a small local business, not a call center."

The AI will clean up your answers, make them consistent in tone, and organize them logically. You review, adjust anything that needs fixing, and now you have a FAQ document you can use everywhere.

Put it on your website. This is the most obvious placement, and if you don't have a FAQ page yet, this is your nudge to create one. It saves customers time and it saves you time.

Add the top three or four answers to your email signature or auto-reply. When someone emails with a general question, your reply can include a link: "You can find answers to common questions here."

Print it. Seriously. If you have a physical location with a waiting area, print your FAQ and put it where people can read it. Laminate it if you want to get fancy. Customers will read it while they wait, and they'll stop asking your front desk the same questions.

This is not a one-time project, either. Update your FAQ every quarter. New questions come up as your business changes. Keep the document alive and it keeps saving you time.

Scheduling and Appointment Automation

If your business involves appointments, estimates, consultations, or any kind of scheduled customer interaction, and you're still managing that entirely by phone, I want you to consider something.

You're playing phone tag. Your customer calls, you're with another customer, you miss it. You call back, they're at work, they miss it. They call again, you're at lunch. This dance can go on for days before you actually book a fifteen-minute appointment.

Meanwhile, your competitor has a "Book Now" button on their website that lets the customer pick a time slot at 10 PM on a Tuesday while they're sitting on their couch. Who do you think gets the appointment?

There are several tools that handle online scheduling, and most of them have free tiers that work fine for small businesses:

Calendly is probably the most well-known. The free version lets you create one event type and share a booking link. Customers see your available times and book themselves. It syncs with Google Calendar so you never double-book.

Cal.com is an open-source alternative that's very similar to Calendly. The free tier is generous and it integrates with most calendar systems.

Acuity Scheduling (owned by Squarespace) is popular with service businesses. It handles intake forms, so customers can provide information when they book instead of you collecting it over the phone.

All three of these connect to Google Calendar or Outlook, so when a customer books a slot, it immediately shows up on your calendar and blocks that time. No double-booking. No forgetting.

Now, I know what some of you are thinking: "My customers prefer to call."

Maybe. Some of them do. And you should absolutely keep accepting phone bookings. This

isn't about taking options away. It's about adding an option.

But here's what I've seen consistently: customers don't prefer calling. They prefer whatever is easiest. And for a lot of people, especially anyone under forty-five, "easiest" means booking online at whatever time is convenient for them, without having to make a phone call during business hours.

Even your customers who do prefer calling — they prefer it when you answer. They do not prefer leaving a voicemail, waiting for a callback, and going back and forth three times. Given the choice between that and clicking a link, many of them will happily click the link.

Start simple. Set up a free Calendly or Cal.com account. Create one appointment type. Set your available hours. Put the booking link on your website, in your email signature, and on your Google Business profile. See what happens. If nobody uses it, you've lost nothing — it's free and it took thirty minutes to set up. If people do use it, you've just eliminated a chunk of phone tag from your week.

One thing to watch out for: set buffer times between appointments. If you have back-to-back thirty-minute slots with no gap, you'll end up running behind by noon. Build in fifteen minutes between appointments for overruns, notes, or just catching your breath. Every scheduling tool lets you configure this.

Data and Spreadsheet Cleanup

I have seen some spreadsheets in my time. I've seen customer lists with three different columns for phone numbers, two of which are blank. I've seen inventory sheets where the same product is listed four times with slightly different names. I've seen financial records that would make an accountant weep.

If this is you, you're not alone. Small businesses accumulate messy data because they're busy running a business, not managing databases. You start a spreadsheet, it works fine for a while, then it grows, gets copied, gets edited by three different people, and eventually becomes something nobody trusts but everybody uses.

AI can help with cleanup, and it's actually pretty good at it. Here's what it can do:

Standardize formatting. If you have a customer list where some phone numbers are formatted as (740) 555-1234 and others are 7405551234 and others are 740-555-1234, AI can standardize them all to one format. Same with addresses, names (fixing capitalization issues), and dates.

Find duplicates. Paste your customer list into an AI tool and ask it to identify likely duplicates — entries that are probably the same person with slightly different information. You'll still need to verify and merge them manually, but AI can flag them quickly.

Organize and categorize. If you have a product list that's grown organically with no consistent categories, AI can suggest a category structure and sort your items into it.

Create summaries. If you have a year of sales data in a spreadsheet and you want to know your top-selling products, busiest months, or average ticket size, AI can analyze the data and give you a plain-English summary.

Here's how to do it practically: export your spreadsheet as a CSV file (every spreadsheet program can do this), paste the contents into an AI chat, and tell it what you need. For example:

> "Here's my customer list exported from a spreadsheet. Clean it up: standardize phone number formats, fix obvious capitalization errors in names, flag likely duplicate entries, and sort alphabetically by last name. Return it in a format I can paste back into a spreadsheet."

Now, the limitations. And these are important.

AI is not a database. It's not a replacement for proper accounting software, inventory management systems, or CRM tools. If your business has grown to the point where a spreadsheet isn't cutting it anymore, the answer isn't to have AI keep patching the spreadsheet. The answer is to move to a proper tool — QuickBooks for finances, a real inventory system for inventory, a CRM for customer management.

AI also should not be your accountant. It can help you organize financial data, but do not rely on it for tax calculations, compliance questions, or financial decisions. That's what your accountant is for. AI can help you get your data clean enough that your accountant doesn't charge you extra for sorting through a mess — and that alone might save you money.

And be careful with sensitive data. If you're pasting customer information, financial records, or anything confidential into an AI tool, you're sending that data to a third-party server. Most major AI tools have privacy policies that say they won't use your data for training, but read the fine print. For highly sensitive information, consider using a local AI tool that runs on your own computer rather than sending data to the cloud. We'll talk more about data privacy in a later chapter.

The Fifteen Hours

Let's add this up.

Standardizing your templates saves you maybe two to three hours a month in formatting time. Creating SOPs saves you untold hours every time you hire someone or take time off. Onboarding documents save you a full day per new hire. A solid FAQ page saves you an hour a week in repetitive questions. Online scheduling saves you one to two hours a week in phone tag. Cleaning up your data saves you hours of frustration and prevents costly errors.

None of these are exciting. None of them will go viral. Your friends' eyes will glaze over if you tell them about your new SOP binder at dinner.

But added up, these operational improvements can easily reclaim ten to fifteen hours a week. That's two full working days. Every week. That's time you can spend on the parts of your business you actually enjoy — serving customers, developing new products, or just going home before 7 PM for once.

The businesses in Lancaster that run smoothly aren't smooth because the owners are superhuman. They're smooth because somewhere along the way, someone took the time to write things down, create systems, and stop reinventing the wheel every day.

AI just makes that process faster. It doesn't do the work for you — you still have to record the voice memo, review the SOP, customize the onboarding doc, and decide which questions go in your FAQ. But it removes the barrier that stopped most business owners from doing this work in the first place: the blank page.

You don't have to stare at a blank page anymore. You talk, paste, prompt, and edit. The bones are built in minutes. The polishing is on you.

Start this week. Pick one section from this chapter — whichever one made you think "yeah, I really should do that" — and do it. One template. One SOP. One FAQ page. Don't try to systematize your entire business in a weekend. Just start.

The boring stuff is the high-value stuff. Always has been.

Part Three: The AI Audit

Chapter 7: The $0 AI Audit — Walk Through Your Own Business

Print this chapter. Grab a pen. This is the most valuable exercise in the book.

I'm serious. If you're reading this on a screen, go print it. Or open a notebook. What we're about to do is worth more than any AI tool I could recommend, because we're going to figure out where *your* time actually goes before we spend a single dollar.

Most AI consultants want to sell you a solution. I want you to understand the problem first. Your problem. Not some generic "small business" problem — yours specifically.

This chapter is a walk-through. We're going to go hour by hour through a typical day at your business, and I'm going to ask you five questions at each stop. By the end, you'll have a clear picture of where AI might actually help you — and where it won't.

No software required. No account to sign up for. Just you, a pen, and some honesty about how you actually spend your time.

The Hour-by-Hour Walk-Through

Pick a recent workday that felt normal. Not your worst day, not your best day. Just a Tuesday. Got one in mind? Good.

We're going to walk through it starting from when you first do anything work-related — and yes, checking email from bed at 6:15 AM counts.

For each hour of your day, I want you to write down what you were doing, then answer these five questions:

Question 1: What are you doing right now?

Write it down plainly. "Answering emails." "On the phone with a supplier." "Writing up an estimate." "Driving to a job site." "Staring at QuickBooks trying to figure out why the numbers don't match." Whatever it is, write it.

Question 2: Is any of it repetitive text work?

Emails where you're saying roughly the same thing you said last week. Forms you're filling out with the same kind of information. Product descriptions, job postings, social media posts, follow-up messages. If you've ever thought "I feel like I've typed this before," that's a yes.

Question 3: Are you answering a question you've answered before?

"What are your hours?" "Do you offer financing?" "How long does it take to get an appointment?" "What's included in the basic package?" If customers, employees, or vendors keep asking you the same things, write it down.

Question 4: Are you playing phone tag or doing manual scheduling?

You called them, they weren't there. They called back, you were with a customer. They left a voicemail, you forgot to return it until 8 PM. Or maybe you're going back and forth — "Does Thursday work?" "No, how about Friday?" "What time?" — through six text messages to book one appointment. Write it down.

Question 5: Is information getting lost between you and someone else?

A customer told your front desk one thing, but it didn't make it to you. You told an employee to order something, but it fell through the cracks. A lead came in from your website, but nobody followed up for three days. If stuff is slipping through gaps between people, that's worth noting.

Now do this for every hour. Yes, every hour. It'll take you maybe twenty minutes. I'll wait.

Your Day, Mapped Out

Here's a blank framework. Fill it in.

TIME	WHAT I'M DOING	Q1	Q2	Q3	Q4	Q5
6:00–7:00	_____	_	_	_	_	_
7:00–8:00	_____	_	_	_	_	_
8:00–9:00	_____	_	_	_	_	_
9:00–10:00	_____	_	_	_	_	_
10:00–11:00	_____	_	_	_	_	_
11:00–12:00	_____	_	_	_	_	_
12:00–1:00	_____	_	_	_	_	_
1:00–2:00	_____	_	_	_	_	_
2:00–3:00	_____	_	_	_	_	_
3:00–4:00	_____	_	_	_	_	_
4:00–5:00	_____	_	_	_	_	_
5:00–6:00	_____	_	_	_	_	_
After 6:00	_____	_	_	_	_	_

Mark each question with a Y (yes), M (maybe), or N (no). When you're done, count up the Y's and M's. That's your opportunity count — the number of places in your day where AI might be worth considering.

If you got fewer than three, either you run the most efficient business in Fairfield County, or you weren't being honest with yourself. Go back and do it again.

If you got more than ten, don't panic. That's normal. It doesn't mean you need ten AI tools. It means there's a lot of repetitive work in running a small business. You already knew that.

The One-Page AI Opportunity Map

Now let's turn those Y's and M's into something useful. Take a fresh sheet of paper and make three columns:

```
TASK DESCRIPTION          | TIME SPENT/WEEK | COULD AI HELP?
--------------------------|-----------------|---------------
                          |                 | Yes / Maybe / No
                          |                 |
                          |                 |
                          |                 |
                          |                 |
                          |                 |
                          |                 |
                          |                 |
                          |                 |
--------------------------|-----------------|---------------
TOTAL HOURS THAT COULD    |                 |
BE SAVED:        ____     |                 |
```

For each Y or M from your walk-through, write down the task, estimate how much time you spend on it per week, and make a judgment call: could AI actually help with this?

Be conservative with the "Yes" answers. If you're not sure, put "Maybe." If it involves physical work, complex judgment calls about people, or anything where getting it wrong would be a serious problem, lean toward "No" or "Maybe."

Add up the hours in the "Yes" and "Maybe" rows. That's your potential time savings. We'll refine this number in Chapter 8, but for now it gives you a ballpark.

Most business owners I've walked through this exercise in Lancaster end up somewhere between five and fifteen hours a week of potentially AI-assistable work. That's a half day to almost two full days. Not bad for twenty minutes with a pen and paper.

What This Looks Like in Practice

Let me walk you through four examples from business types I see all the time around here. These aren't real people, but they're composites of real patterns. See if any of them sound familiar.

The HVAC Contractor

Dave gets to his shop at 7:00 AM. First thing he does is check voicemails from last night — three people wanting quotes, one person with an emergency, two people asking if they can reschedule. He spends forty-five minutes returning calls. Reaches two of them. Leaves three voicemails. Phone tag has begun.

By 8:30, he's writing up two estimates based on yesterday's site visits. He pulls up an old estimate, changes the address and a few line items, and sends it out. He's done this roughly four hundred times.

9:00 to 3:00, he's on job sites. Good. This is the work. AI can't install a furnace.

At 3:30, he's back in the truck answering texts. "When can you come out?" "What does the warranty cover?" "Can I get a copy of that invoice from March?" He types the same answers he typed last week, with his thumbs, in a truck that's still running in a driveway on Cedar Hill.

By 5:00, he's doing paperwork. Entering job details. Writing up notes for the next day. Sending follow-up emails.

Dave's audit turns up about eight to ten hours a week of potentially AI-assistable work. The biggest chunks: phone tag and scheduling (three to four hours), writing estimates from templates (two hours), answering repetitive customer questions (one to two hours), and follow-up emails (one hour).

The Restaurant Owner

Maria opens at 6:00 AM. Before the first customer sits down, she's already dealt with a call-off (now she's texting to find coverage), checked last night's numbers, and started working on this week's social media posts. She's staring at her phone trying to think of what to post about Wednesday's special.

The lunch rush is physical work. Cooking, managing the line, handling a complaint about a wrong order. No AI is going to help here.

But from 2:00 to 4:00, during the lull, Maria is answering the phone — "What are today's specials?" "Do you have gluten-free options?" "Can I book a table for twelve on Saturday?" — and she's also trying to update the menu on three different platforms (her website, Google, and DoorDash), writing a job posting because she lost another server, and responding to two Google reviews.

After close, she's doing inventory and placing orders.

Maria's audit: six to eight hours a week. Social media content (two to three hours), answering repetitive phone questions (one to two hours), responding to reviews (one hour), updating menus across platforms (one hour), writing job postings (occasional but painful).

The Attorney

Tom gets to his office on Main Street at 8:00. By 8:15, he's reading emails — twenty-three of them. About half need substantive responses, but the other half are scheduling, status updates, and questions he's answered so many times he could recite them in his sleep. "How long does a closing typically take?" "What documents do I need to bring?" "What are your fees for a simple will?"

From 9:00 to noon, he's in meetings and doing actual legal work. Drafting documents, reviewing contracts, talking to clients. Some of this involves a lot of standard language that gets customized per client, but it requires his judgment. Maybe territory, maybe not.

Afternoon: more emails, returning calls, dictating notes from meetings that his paralegal will type up, trying to write a newsletter he promised himself he'd send monthly (it's been four months).

Tom's audit: five to seven hours a week. Email triage and drafting responses (two to three hours), answering standard client questions (one hour), drafting standard-language documents (one to two hours — this one's a "maybe" because accuracy matters enormously), and that newsletter he never writes (one hour per month, but the guilt takes up more space than that).

The Retail Store Owner

Kim runs a shop on the square. She arrives at 9:00, opens at 10:00. That first hour is emails from suppliers, checking online orders from her Shopify site, and writing product descriptions for three new items she got in yesterday. Each product description takes her about fifteen minutes because she wants them to sound right.

During store hours, she's helping customers. That's the job. That's why people come to a shop on the square instead of ordering from Amazon.

But between customers, she's on her phone: posting to Instagram, answering DMs ("Do you have this in blue?" "What are your hours?" "Can you hold something for me?"), and trying to figure out what to do about the eleven items that have been sitting on the shelf for three months.

After close, she's reconciling the register, updating inventory, and writing thank-you emails to a few customers who made big purchases.

Kim's audit: seven to nine hours a week. Product descriptions (two to three hours), social media (two hours), answering repetitive DMs and messages (one to two hours), thank-you and follow-up emails (one hour), and writing promotional copy for sales and events (one hour, when it happens).

What You Probably Noticed

Look at your own audit and look at these four examples. There are patterns. The same kinds of tasks keep showing up:

- **Repetitive writing.** Emails, descriptions, posts, estimates, responses. Different words,

same structure, over and over.
- **Answering the same questions.** From customers, clients, patients, vendors. The same fifteen questions generate 80% of inquiries.
- **Scheduling and phone tag.** The most universally hated time-waster in small business. Everyone deals with it. Nobody likes it.
- **Information stuck in your head.** You know the answer, your employee doesn't. The customer told one person, but not the person who needs to know. Things fall through cracks not because anyone is careless, but because there's no system.

These patterns are exactly where AI is useful today. Not in some hypothetical future. Right now, with tools that exist, many of which are free or cheap.

They're also, and this matters, the kinds of tasks where AI making a mistake isn't catastrophic. If an AI drafts a slightly imperfect email and you fix two words before sending it, no harm done. If an AI answers "What are your hours?" incorrectly, that's annoying but fixable. The stakes are low enough that imperfection is tolerable.

That's the sweet spot. Repetitive, text-based, low-stakes, high-frequency. Write that on your opportunity map somewhere. Maybe circle it.

What Didn't Show Up

Notice what's not on anyone's list: the actual work. Dave installing furnaces. Maria cooking. Tom giving legal advice. Kim helping a customer pick out a gift.

AI doesn't replace the thing that makes your business your business. It handles the stuff around the thing. The administrative wrapper. The operational tax you pay for the privilege of doing the work you actually care about.

If someone tells you AI is going to replace what you do, they're either wrong or they don't understand what you do. What it can do is give you back some of the hours that get eaten by the stuff around it.

Your Homework

You have a list now. Some tasks with "Yes" next to them, some with "Maybe," and a rough estimate of hours.

That list is worth real money. Not because I'm going to sell you something — because you now know, specifically, where your time goes and which parts of it might be recoverable.

But a list without a plan is just a list. You need to know what to do first, what to do later, and what to skip entirely.

Now you have a list. Chapter 8 will help you figure out what to do first.

Chapter 8: Scoring Your Opportunities

You've got a list from Chapter 7. Maybe it's got five things on it, maybe fifteen. Either way, you're staring at it thinking: "Okay, now what?"

Now we prioritize. Because if you try to do everything at once, you'll do nothing. I've watched this happen. A business owner gets excited, signs up for four tools in one afternoon, configures none of them properly, gets frustrated by Thursday, and goes back to doing everything the old way by the following Monday. Don't be that person.

We're going to use a simple framework. Two axes, four boxes. You probably saw something like this in a management book once, or maybe on a napkin at a chamber of commerce meeting. It works because it's simple, and simple is what you need when you're running a business and don't have time to build spreadsheet models.

The 2x2 Matrix

Draw a big plus sign on a piece of paper. You now have four boxes.

The horizontal axis — left to right — goes from **Easy to Implement** to **Hard to**

Implement.

The vertical axis — bottom to top — goes from **Low Time Savings** to **High Time Savings**.

Label the four boxes:

```
                    HARD TO IMPLEMENT
                    |
    Quadrant 2:     |     Quadrant 4:
    PLAN FOR LATER  |     IGNORE
                    |
HIGH TIME ___________|___________ LOW TIME
SAVINGS             |           SAVINGS
                    |
    Quadrant 1:     |     Quadrant 3:
    DO THIS FIRST   |     NICE TO HAVE
                    |
                    EASY TO IMPLEMENT
```

That's it. That's the whole framework.

Quadrant 1: Easy to Implement + High Time Savings. This is where the gold is. These are the things you can start doing this week with minimal setup that will give you noticeable time back. Do these first.

Quadrant 2: Hard to Implement + High Time Savings. These are real opportunities, but they require more setup, more money, or more technical help. Plan for these. Put them on the calendar for next month or next quarter. Don't ignore them, but don't start here.

Quadrant 3: Easy to Implement + Low Time Savings. Sure, why not. If you've got a slow afternoon and you've already tackled Quadrant 1, knock these out. They're easy wins, even if they're small wins. Nice to have.

Quadrant 4: Hard to Implement + Low Time Savings. Forget it. Seriously. These are traps. They'll eat your time, cost money, and save you twenty minutes a week. Every AI vendor in America wants to sell you something in Quadrant 4 and convince you it's in Quadrant 1. Now you know how to tell the difference.

Scoring Your Items

Go back to your Opportunity Map from Chapter 7. For each item with a "Yes" or "Maybe," you need to answer two questions:

How easy is this to implement?

"Easy" means: you could do it yourself, today, with tools that already exist, for free or close to free. Signing up for ChatGPT and using it to draft emails is easy. Setting up an automated phone answering system with a custom AI voice agent is not easy — it's valuable, but it requires configuration, testing, and probably some help.

Here's my rule of thumb:

- **Easy:** You can do it with a tool you can sign up for in five minutes, and it works with copy-paste or simple typing. No integrations, no custom setup.
- **Medium:** You need to connect something to something else, or customize a template, or spend a few hours configuring. You could probably do it yourself, but it'll take a weekend.
- **Hard:** You need someone to build something, or you need to change a business process, or the tool requires real technical setup. This is "hire someone or dedicate serious time" territory.

For the matrix, "Easy" goes on the left side. "Medium" goes somewhere in the middle — use your judgment about whether it leans easy or hard. "Hard" goes on the right.

How much time will this actually save?

Be realistic. Not optimistic, not pessimistic. Realistic. Here are some honest estimates based on what I've seen working with businesses around Lancaster:

Email drafting: 3-5 hours per week saved. This is the biggest easy win for most people. If you're writing more than ten emails a day — and most business owners are — having AI draft the first version saves real time. You still read it, you still edit it, you still hit send. But the "staring at a blank message trying to figure out how to phrase this" part goes away. For people who dread writing, this is life-changing. For people who are already fast writers, it's more like

two hours saved. Still worth it.

Social media content: 2-3 hours per week saved. If you're posting three to five times a week (which you probably should be, but probably aren't), AI can generate drafts of posts, suggest ideas, and help you repurpose one piece of content into several. You still need to add your voice, pick the photos, and make sure it doesn't sound like a robot wrote it. But the "I don't know what to post" paralysis goes away, and that alone is worth two hours of your week.

Customer FAQ handling: 1-2 hours per week saved. This one's deceptive. An hour or two doesn't sound like much, but it's an hour or two of interruptions — the kind that pull you out of real work. If you can put your top fifteen FAQs somewhere that customers can find them (your website, an auto-response, a chatbot), you reduce the interruptions. The time savings are real but hard to measure because they're scattered across the day.

Phone handling with a voice agent: 5-10 hours per week saved, but… This is the big one, and it comes with a big asterisk. An AI voice agent that answers your phone, handles basic questions, and books appointments can save you enormous amounts of time. Five to ten hours a week is realistic for businesses that get a lot of calls. But — and this is a significant but — setting one up properly is not a weekend project. It requires choosing a platform, scripting the conversations, testing it, handling edge cases, and making sure it doesn't make your customers feel like they're trapped in an automated phone tree from 2005. This is Quadrant 2 for most people. High savings, but hard to implement well. Plan for it, don't rush it.

SOP creation: a one-time 10-20 hour investment, then it's done. Standard Operating Procedures — the "how we do things" documentation that every business needs and almost no business has. AI is shockingly good at helping you create these. You talk through how something is done, feed the transcript to an AI, and it spits out a structured document. You clean it up, and now you have an SOP. This isn't a weekly time savings; it's a one-time investment that pays off every time you train a new employee, every time someone asks "how do we handle this," and every time you need to remember your own process six months from now. Consider it a separate project rather than a weekly line item.

The Monday Morning Test

Here's a quick gut check for whether something belongs in Quadrant 1.

Ask yourself: **Could I implement this before lunch on Monday?**

Not "could I theoretically start this on Monday." Could you actually have it working — as in, saving you time — by noon on Monday?

If yes, it's Quadrant 1.

If the answer is "well, I'd need to research the tools first," it's probably still Quadrant 1, but barely.

If the answer is "I'd need to set up an account, figure out the integrations, test it, and…" it's Quadrant 2.

If the answer is "I'd need to hire someone," it's definitely Quadrant 2.

The Monday Morning Test keeps you honest. It's the difference between doing something and planning to do something. Planning feels productive but it doesn't save you any time until the plan becomes action.

Let me give you some examples:

Passes the Monday Morning Test: - Sign up for ChatGPT (or use the free version) and start drafting customer emails with it. - Use AI to write this week's social media posts. - Feed your employee handbook to an AI and ask it to create a FAQ document for new hires. - Use AI to rewrite your "About Us" page that hasn't been updated since 2019.

Does not pass the Monday Morning Test: - Set up an AI chatbot on your website. - Implement an AI phone answering system. - Build an automated workflow that takes a customer inquiry from your website, creates a record in your CRM, and sends a personalized follow-up email. - Create a complete set of SOPs for your entire business.

Notice: the things that don't pass the test aren't bad ideas. Some of them are great ideas. They're just not Monday morning ideas. They're Thursday afternoon planning session ideas. They're next month ideas. They're "block off four hours and actually do this" ideas.

Building Your Priority List

Take your Quadrant 1 items. You should have somewhere between two and five of them. If you have more than five, you're being too generous with what counts as "easy."

Now rank them by time savings. Biggest time savings first.

That's your priority list. Do them in order.

Here's what it might look like for those four Lancaster business owners from Chapter 7:

Dave the HVAC contractor: 1. Use AI to draft estimate emails and follow-ups (3 hours/week saved) 2. Create a standard FAQ response template for common customer questions (1 hour/week saved) 3. Use AI to write the "What to expect" email he sends before every job (30 minutes/week saved)

Maria the restaurant owner: 1. Use AI to batch-create social media posts for the week (2 hours/week saved) 2. Use AI to draft responses to Google reviews (1 hour/week saved) 3. Use AI to write job postings (occasional, but removes a painful task)

Tom the attorney: 1. Use AI to draft routine email responses (3 hours/week saved) 2. Use AI to create client-facing FAQ documents (1 hour/week saved, ongoing) 3. Use AI to draft that monthly newsletter he keeps not writing (1 hour/month, plus guilt reduction)

Kim the retail store owner: 1. Use AI to write product descriptions (2 hours/week saved) 2. Use AI to draft social media content (2 hours/week saved) 3. Use AI to write thank-you and follow-up emails (1 hour/week saved)

Notice something? Everyone's Quadrant 1 list involves writing. That's because writing is the task where AI delivers the most obvious, immediate value with the least setup. You type a prompt, you get a draft, you edit it, you're done. No integrations. No technical setup. No risk.

It's not glamorous. It's not "the future of business." It's practical time savings that starts this Monday.

The Things That Didn't Make the List

Your Quadrant 2 items — the ones with high savings but harder implementation — deserve a page of their own. Write them down somewhere you'll actually see them. A sticky note on your monitor. A reminder in your phone for thirty days from now.

These are your next projects. After you've been using AI for the easy stuff for a month and it feels normal — because it will feel normal remarkably fast — come back to Quadrant 2 and pick the top item. Now that thing becomes your project.

The phone handling voice agent that could save Dave ten hours a week? That's a Quadrant 2 project. It's worth doing. It's just not worth doing first. Do the easy wins, build confidence, understand how AI actually works in your daily life, and then tackle the bigger stuff with realistic expectations.

Your Quadrant 4 items? Cross them out. Literally draw a line through them. They will tempt you. Some vendor will send you an email about an AI-powered solution that addresses exactly that item, and it'll sound amazing, and you'll think "maybe I should…" No. You shouldn't. The time savings don't justify the effort. That's what Quadrant 4 means. Move on.

An Honest Note

You will not do all of this.

That's fine.

If you do ONE thing from your Quadrant 1 list, you're ahead of 90% of businesses your size. I mean that literally. Most small businesses are still in the "I should really look into that AI stuff" phase. They're thinking about it. Reading articles about it. Maybe they tried ChatGPT once to write a poem and thought "huh, that's neat" and then went back to typing emails from scratch.

If you take one task — just one — and start using AI to help with it this week, you've moved from thinking to doing. That's the gap that matters. Not the gap between using one AI tool and using ten. The gap between zero and one.

So pick one thing. The top item on your Quadrant 1 list. Start there.

It doesn't need to be perfect. Your first AI-drafted email is going to need editing. Your first AI-generated social media post might sound a little off. That's fine. Your first attempt at anything is a little off. You get better at prompting the same way you get better at anything — by doing it, noticing what works, and adjusting.

In Chapter 9, we'll get into the specific tools that are worth your time and money right now. But the tool doesn't matter if you don't know what to use it for. Now you know. You've got a list, you've scored it, and you've got a starting point.

Go do the thing.

Part Four: When to Get Help

Chapter 9: AI Voice Agents — The Website of 2025

The Analogy You Need to Hear

Cast your mind back to 2005.

If you were running a business in Lancaster back then, you probably remember the conversation. Someone — maybe a nephew, maybe a guy at Rotary, maybe that one friend who was always a little too excited about computers — told you that you needed a website.

And you probably said something like: "Why? Everyone around here knows where we are. We're in the phone book. We've got a sign out front."

A lot of business owners said exactly that. And for a while, they were right. The phone book still worked. The sign still worked. Word of mouth still worked.

But then something shifted. Slowly at first, then all at once. People stopped opening the Yellow Pages. They started typing things into Google. And the businesses that had websites — even ugly ones, even ones that were basically just their hours and a phone number on a white background — started showing up. The businesses that didn't have websites started disappearing. Not overnight. But steadily. Relentlessly.

The early adopters didn't have better websites. They just had websites. That was enough to create an advantage that lasted years.

I'm telling you this because voice agents are the website of 2025.

Right now, most small businesses don't have one. Most small business owners have barely heard the term. The ones who set one up in the next year or two are going to have an advantage — in customer experience, in efficiency, in revenue captured — that their competitors won't match for a long time.

That's not hype. That's pattern recognition. I've seen this movie before, and so have you.

What a Voice Agent Actually Is

Let me strip away all the jargon.

A voice agent is software that answers your business phone. That's it at the core. But unlike the terrible automated phone trees you've been dealing with for the last twenty years — "Press 1 for sales, press 2 for support, press 0 to scream into the void" — a modern voice agent actually has a conversation with the person calling.

Here's what it can do:

Understand what the caller wants. Not from a menu of numbered options, but from natural speech. Someone calls and says, "Hey, I need to get my furnace looked at, it's making a weird noise," and the voice agent understands that this is a service request. Someone else calls and says, "What time do you close on Saturdays?" and it understands that's a simple question.

Someone calls and says, “My basement is flooding and I need someone NOW,” and it understands that’s urgent.

Book appointments directly on your calendar. The voice agent connects to whatever calendar system you use — Google Calendar, your scheduling software, whatever — and can see your available slots in real time. It offers the caller a time, they agree, and the appointment shows up on your calendar. Done. No back-and-forth phone tag. No sticky notes that fall behind the desk.

Answer common questions. Hours, location, pricing, what services you offer, whether you’re taking new clients, how to find the parking lot — all the questions you answer fifteen times a day and are tired of answering. You give the voice agent this information once, and it handles those calls forever.

Take messages and route urgent calls. When someone calls about something the voice agent can’t handle — a complex problem, an angry customer, a genuine emergency — it takes a message, captures the caller’s information, and sends it to you immediately. You can set rules: “If someone says the word ‘emergency’ or ‘flooding’ or ‘gas smell,’ call my cell phone right away.”

Work around the clock. A voice agent answers the phone at 2 AM on a Sunday. It answers on Christmas. It answers when you’re on vacation. It answers when you’re in the middle of a job and your hands are covered in grease. It never calls in sick, never has a bad day, never puts someone on hold because it’s dealing with another call. It handles multiple calls simultaneously, which is something even the best receptionist can’t do.

That’s it. No mystery. It’s a tireless, reasonably smart phone answerer.

What They Sound Like

If your mental model of an automated phone system is the robotic voice from 1998 that mispronounced your street name, I need you to update that image.

Modern voice agents sound remarkably human. Not perfect — we’ll get to that — but remarkably close. They have natural cadence. They pause in the right places. They use filler words like “let me check on that” the way a real person would. They respond to what you’re actually saying, not what a menu expects you to say.

You can have a back-and-forth conversation with them. You can interrupt them. You can change your mind mid-sentence — “Actually, wait, not Thursday, what about Friday?” — and they follow along.

They’re not going to fool anyone into thinking they’re human for an extended conversation. And they shouldn’t. If a caller asks, “Am I talking to a real person?” a properly set up voice agent will tell the truth: “I’m an AI assistant for [your business name]. I can help you with scheduling, answer questions, or connect you with a team member.” Honesty is the right approach here, and most callers genuinely don’t care as long as their problem gets solved.

What callers care about is this: Did I get what I called for? If the answer is yes — the appointment is booked, the question is answered, the message is taken — they don’t care whether it was a human or a machine on the other end. They care about the outcome.

Who Benefits Most

Voice agents aren’t for every business. If you’re a solo consultant who gets three calls a week and enjoys talking to each one, you don’t need this. If your business is mostly walk-in traffic, this isn’t your priority.

But there’s a specific type of business where voice agents are almost absurdly useful, and it’s this: any business where the owner or employees are too busy doing the actual work to answer the phone consistently.

That covers a lot of ground in Lancaster.

Service businesses. HVAC companies, plumbers, electricians, cleaning services. These folks are out on jobs all day. Every call they miss is a potential customer who calls the next company on the list. A voice agent means that call gets answered, the appointment gets booked, and the customer never even knows you were elbow-deep in a water heater when they called.

Medical and dental offices. The front desk staff at a dentist’s office spends an enormous

amount of time on the phone — scheduling, rescheduling, confirming, answering the same questions about insurance and hours. A voice agent handles the routine calls, freeing up the human staff for the patients standing right in front of them.

Hair salons and barber shops. This is where the example gets really clear, and I'll dig into it in a moment.

Auto repair shops. "When will my car be ready?" "Do you work on Toyotas?" "How much for an oil change?" These are high-volume, repetitive calls. A voice agent eats these for breakfast.

Any business where missing a phone call means losing a customer. That's the common thread. If someone calls you, doesn't get an answer, and calls your competitor instead — you need a voice agent. Because that math is brutal. Every missed call is a missed chance at revenue, and you'll never even know it happened.

The Barber Shop

This example comes from a podcast conversation that was one of the sparks for this book, and it's my favorite because it's so clean.

Think about a barber. Specifically, think about a barber in a one-chair or two-chair shop. The kind of shop you'd find on Main Street or over on Columbus Street here in Lancaster.

This barber is cutting hair all day. That's the job. Hands full. Clippers buzzing. Customer in the chair. When the phone rings, the barber has exactly three options:

One: Stop mid-haircut, put down the clippers, walk over to the phone, and have a conversation about scheduling while the customer in the chair sits there with half a haircut. This is bad for the customer in the chair, bad for the barber's pace, and bad for everyone's mood.

Two: Let it go to voicemail. The caller leaves a message — maybe. More likely, they hang up and call the next barber shop. Or they go online and book somewhere else. The barber loses the business and never knows it.

Three: Hire someone to answer the phone. For a one-chair barber shop, this is absurd. You're not going to pay someone $15-20 an hour to sit there and answer eight calls a day.

Now here's option four: a voice agent.

The phone rings. The voice agent picks up. "Hey, thanks for calling [barber shop name]. I can help you book an appointment or answer any questions. What can I do for you?"

The caller says, "I need a haircut this week, what do you have open?"

The voice agent checks the barber's calendar — the real calendar, in real time — and says, "I've got a slot Thursday at 2 PM or Friday at 10 AM. Either of those work?"

The caller picks one. The voice agent books it, sends a confirmation text to the caller, and adds it to the barber's calendar. The whole thing takes ninety seconds.

Meanwhile, the barber hasn't stopped cutting. The customer in the chair didn't get interrupted. The caller got their appointment. Everyone wins.

The pitch, in a sentence: Make more money. Never talk on the phone again.

That's not a gimmick. That's what it actually does. For a barber, or a plumber, or a cleaning service, or a mobile mechanic — anyone whose hands are busy doing the work that makes them money — a voice agent is the difference between capturing revenue and losing it.

What It Actually Costs

Here's where I put real numbers on the table, because this is a no-hype book and you deserve to know what you're getting into.

A voice agent has a few cost components:

The platform. Voice agents run on platforms like Vapi, Retell, Bland, and a few others. These platforms charge by the minute of call time. Current rates are roughly $0.07 to $0.15 per minute, depending on the platform and features you need. This covers the AI processing, the voice synthesis, and the phone infrastructure.

A phone number. You need a dedicated phone number for the voice agent. This runs $1 to $2 per month. You can either forward your existing business number to it, or use the new number directly.

Setup. This is where the cost varies the most. If you hire a consultant — someone like me — to build and configure your voice agent, you're looking at $1,500 to $3,000 for initial setup. That includes designing the conversation flows, integrating with your calendar, loading your business information, testing extensively, and making sure it handles the weird edge cases your particular business encounters. If you're technical and want to do it yourself, the platform costs are minimal but the time investment is real. More on that in a minute.

Monthly maintenance. A voice agent isn't a set-it-and-forget-it tool. It needs monitoring and adjustment, especially in the first few months. A consultant will typically charge $200 to $350 per month for ongoing maintenance — reviewing call recordings, fixing issues, updating information, and improving the agent's responses based on real calls.

Your actual per-call cost. When you do the math, a typical 3-5 minute call costs you roughly $0.50 to $2.00 in platform fees. That's it. Fifty cents to two dollars to have a call answered, a question resolved, or an appointment booked.

Now compare that to the alternatives.

A part-time receptionist working 20 hours a week at $15-20 an hour costs you $1,200 to $1,600 per month, plus payroll taxes, plus the headache of managing another employee. And that receptionist only works during their scheduled hours. Calls at 7 PM? Voicemail. Calls on their day off? Voicemail.

A missed call that sends a customer to your competitor costs you whatever that job was worth. For an HVAC company, that might be $200 for a simple repair or $5,000 for a system replacement. For a barber, it's $25 for a haircut — but multiply that by a customer who might have come back every three weeks for years, and suddenly that missed call cost you thousands in lifetime value.

I'm not going to insult your intelligence by pretending the ROI math is complicated. It's not. If a voice agent catches even a few calls per month that would have otherwise been missed, it pays for itself. For most service businesses, the payback period is measured in weeks, not months.

What Can Go Wrong

This is the section that a lot of voice agent vendors won't include in their pitch. I'm including it because I'd rather you go in with eyes open than get surprised.

It will occasionally misunderstand people. Heavy accents, strong background noise, people who mumble, people who talk in long rambling sentences without getting to the point — the voice agent will sometimes get confused. This isn't a hypothetical; it happens. The question isn't whether it will happen, but how often and how the system handles it. A well-built voice agent will recognize when it's confused and either ask for clarification or offer to take a message and have a human follow up.

It can't handle truly complex or emotional conversations. If someone calls crying because their pipe burst and their house is flooding and they're panicking, a voice agent can capture the emergency and route the call to you immediately — but it's not going to provide the emotional reassurance that a compassionate human can. If someone calls with a problem that requires real judgment, creative problem-solving, or empathy, the voice agent should hand that off quickly and gracefully. The good news is that most calls aren't that. Most calls are routine. The voice agent handles the routine and frees you up for the calls that actually need you.

Some customers will hate it. I'll be straight with you: there are people — often older customers, but not exclusively — who will not want to talk to an AI. Period. They want a human, and no amount of impressive technology will change their mind. You need a fallback plan for these folks. The simplest one: "If you'd prefer to speak with a person, I can take your name and number and have someone call you back within the hour." That usually works. The customer feels heard, you get their info, and you call them back when you can.

It needs to be kept current. Change your hours for the holidays? The voice agent needs to know. Add a new service? The voice agent needs to know. Raise your prices? The voice agent needs to know. If you don't update it, it will cheerfully give callers wrong information, which is worse than no information at all. This is the main reason ongoing maintenance matters. It's not that the technology breaks — it's that your business changes and the agent needs to change with it.

The first month is the hardest. No matter how well a voice agent is set up, the first month of real calls will surface issues nobody anticipated. Callers will ask questions you didn't think to prepare for. They'll phrase things in ways the agent doesn't expect. They'll try to do things the agent wasn't designed to handle. This is normal. It's also why you should plan to review call recordings regularly during that first month and make adjustments. By month two or three, most of the kinks are worked out and it runs much more smoothly.

None of these problems are dealbreakers. They're just the reality of working with a tool that's very good but not perfect. If someone tells you their voice agent never has issues, they're either lying or they're not listening to the call recordings.

How to Evaluate a Voice Agent Vendor

If you decide to hire someone to set up a voice agent for your business — and for most people, that's the right move — here's how to separate the good vendors from the ones who are just riding the hype wave.

The test call method. This is the single best evaluation technique, and it's free. Ask the vendor for a demo line — a number you can call to talk to a voice agent they've built. Then call it. Not once. Five times. With different questions each time.

Call once and ask about hours. Call again and ask about pricing for a specific service. Call a third time and ask something weird — something a real customer might ask that's slightly off-script. "Do you guys do gift certificates?" "Can I bring my dog?" "What's parking like?" Call a fourth time and pretend to be confused or upset. Call a fifth time and ask to speak to a human.

Watch how the agent handles each scenario. Does it answer correctly? Does it handle the unexpected gracefully? Does it hand off to a human when it should? Does it maintain a natural conversation, or does it sound like it's reading a script? This tells you more about a vendor's quality than any slide deck or sales pitch ever will.

Ask the right questions. Beyond the test call, there are four questions every voice agent vendor should be able to answer clearly:

"What happens when the AI doesn't know the answer?" This is crucial. The right answer is some version of: it acknowledges it doesn't have that information, offers to take a message, and routes the question to a human. The wrong answer is: "That won't happen." It will absolutely happen.

"Can I listen to recordings of all calls?" The answer should be yes, without hesitation. You need to be able to review how the agent is performing with real callers. Any vendor who makes this difficult or charges extra for it is waving a red flag.

"What's the process for updating information?" Things change. Your hours change. Your pricing changes. You add or remove services. How hard is it to update the voice agent? Is there a portal you can use yourself, or do you have to email the vendor and wait? How long does it take for changes to go live? This is the nuts and bolts of ongoing maintenance, and you need to understand it before you sign anything.

"What are your actual platform costs versus what you're charging me?" This is a Leo Guinan special. I include it because transparency matters. If a vendor is paying $0.10 per minute in platform costs and charging you $0.50 per minute, that's a 5x markup. That's not inherently wrong — they're providing expertise, maintenance, and support — but you should know what the markup is. A vendor who gets squirmy about this question is a vendor who doesn't want you to understand the economics. You're a business owner. You should always understand the economics.

The DIY Option

If you're technically inclined — or if you have someone in your life who is — you can build a voice agent yourself. I want to be honest about what that involves.

Platforms like Vapi and Retell are designed to be developer-friendly. They have documentation, tutorials, and APIs that a reasonably technical person can work with. There are also open-source options emerging that give you even more control, though they require more technical skill.

The realistic time investment for a DIY setup is 20 to 40 hours. That's not 20 hours of clicking buttons. That's 20 to 40 hours of learning the platform, designing conversation flows, integrating with your calendar and phone system, writing the prompts that tell the AI

how to behave, testing extensively, and troubleshooting the things that don't work right the first time. Or the second time.

If you value your time at $50 an hour, the DIY route costs you $1,000 to $2,000 in time — comparable to hiring someone, but with the advantage that you understand your own system deeply and can modify it anytime.

The ongoing costs for a DIY setup are significantly lower: roughly $50 to $100 per month for platform fees and phone costs, depending on your call volume. That's compared to $200 to $350 per month when you include a consultant's maintenance fee.

The tradeoff is your time. When something breaks — and eventually something will — you're the one fixing it. When you need to update the agent's knowledge, you're the one doing it. When a caller reports a bad experience, you're the one reviewing the recording and figuring out what went wrong.

For some business owners, especially those who genuinely enjoy technology, this is the right path. For most, I'd recommend hiring someone for the initial setup and then deciding after a few months whether you want to take over the maintenance yourself. By then you'll understand how the system works and can make an informed choice.

The Timing Question

I want to come back to the website analogy one more time, because the timing piece matters.

In 2005, the businesses that built websites didn't get better websites than the ones who waited until 2010. They just got them first. And those five years of being findable online while their competitors weren't — that compounded. They built up search rankings. They captured customers who then became loyal. They established an online presence that new competitors had to work hard to match.

Voice agents are at that same inflection point. The technology is good enough right now. Not perfect — it'll be better next year, and better still the year after that — but good enough to provide real value today. The businesses that deploy them now will capture the calls their competitors are missing. They'll provide a better customer experience than the competitors who are still sending everything to voicemail after 5 PM. They'll book appointments at 10 PM on a Tuesday when someone suddenly realizes they need to get their air conditioning serviced before summer.

And when their competitors eventually catch up in two or three years, the early adopters will have had two or three years of captured revenue and customer relationships that the latecomers can't get back.

I'm not saying you need to panic and get a voice agent this week. I am saying that if you own a service business and your phone goes unanswered even a few times a day, this should be at the top of your list.

The Honest Bottom Line

Voice agents aren't magic. They're a tool. Like every tool in this book, they work best when a human is paying attention to how they're performing and making adjustments. You can't set one up and walk away forever. You can't expect it to handle every possible scenario with the grace of your best employee on their best day.

But you also can't answer the phone while you're under a sink. You can't be in two places at once. You can't work twenty-four hours a day, seven days a week, without burning out or making mistakes of your own.

For a service business in Lancaster — or Circleville, or Logan, or any of the small towns in this part of Ohio where people still call the phone number on the sign out front — a voice agent solves a real problem. Not a theoretical problem. Not a problem that only exists in Silicon Valley pitch decks. The real, daily, grinding problem of missing calls and losing customers because you were too busy doing the work to answer the phone.

The technology is here. The costs are reasonable. The ROI is clear.

For the right business, a voice agent is the single highest-ROI AI investment you can make right now. Not because it's flashy. Not because it's the future. Because it picks up the phone when you can't, and it turns missed calls into booked appointments.

That's not magic. That's just good business.

Chapter 10: Custom Automations — When Off-the-Shelf Isn't Enough

If you've been following along through this book, you've already got a pretty solid toolkit. ChatGPT for writing and thinking. A voice agent answering your phones. Maybe some social media help. For a lot of businesses in Lancaster, that's the whole ballgame. You can stop here, save some money, win back some hours, and go fishing.

But some of you are still reading because you've got a nagging feeling. You've got workflows that are held together with sticky notes and memory. You've got three different software tools that don't talk to each other. You've got a process that works, technically, but it requires someone to manually copy information from one place to another six times a day, and every time they forget, something falls through the cracks.

This chapter is for you. It's about what happens when the off-the-shelf stuff isn't enough, and you need something built for the way your business actually works.

Fair warning: this is where costs go up. Not dramatically — not like buying a new truck or leasing a storefront — but we're no longer in the land of free tiers and $20/month subscriptions. So I'm going to be direct about when this makes sense and when it doesn't.

CRM: A System That Remembers Your Customers So You Don't Have To

Let's start with CRM, because it's the thing most businesses need and the thing most business owners' eyes glaze over about.

CRM stands for Customer Relationship Management. That sounds like something a Fortune 500 company invented to justify a department. Here's what it actually means: it's a system that keeps track of every customer you've ever talked to, what you talked about, what they bought, when they bought it, and when you should follow up.

You know how your best salesperson — the one who's been with you fifteen years — just *knows* that Mrs. Henderson prefers to be called in the morning, that she always needs her furnace checked in October, and that her daughter just had a baby? A CRM is the software version of that person's brain. Except it doesn't retire, it doesn't call in sick, and it doesn't take all that knowledge with it when it leaves for a competitor.

If you've got fewer than fifty customers and a good memory, you might not need one. If you've got more than that, or if you've ever lost a sale because nobody followed up, you need one.

The Free Options (Start Here)

Before you spend a dime, try the free stuff.

HubSpot Free Tier. HubSpot is a big company that makes CRM software. Their free tier is legitimately useful — not a "free trial" that expires, but an actual free product. You can store up to a million contacts, track deals, log emails, and set reminders to follow up. The catch? They want you to eventually upgrade to their paid plans, which start around $20/month and go way up from there. But plenty of small businesses run on the free tier for years.

Google Contacts + Google Sheets. This is the duct-tape version. You keep your contacts in Google Contacts, and you track your deals and follow-ups in a Google Sheet. It's not elegant. It doesn't automate anything. But it's free, it works, and if you've got a business with under a hundred active customers, it might be all you need. I know a landscaping company in Fairfield County that's run this way for three years and it works fine.

When You Need Something Custom

Here's where things get interesting.

The free CRMs are built for everyone, which means they're built for no one in particular. If you're a plumber, your workflow is different from a real estate agent, which is different from a dog grooming salon. The generic CRM doesn't know that. It gives you the same fields, the same layout, the same process — and you end up bending your workflow to match the

software instead of the other way around.

This is where the custom CRM comes in. And thanks to what's happening in software development right now, these are dramatically cheaper than they were even two years ago.

There's a revolution happening called "vibe coding" — which is a silly name for a real thing. Tools like Replit, Cursor, and similar platforms let developers (and increasingly, non-developers) build custom applications using AI assistance. You describe what you want, the AI writes most of the code, and a developer cleans it up and makes it work. What used to take a team of five developers three months can now be done by one person in a few weeks.

Here's a real example I heard on the My First Million podcast: a guy started building custom CRM applications for small businesses. Each one cost the client about $15,000. He did it with a small team using AI-assisted development. His first year, he did $2.5 million in revenue with 60% margins. That's not because he was ripping people off — it's because the tools have gotten that much faster and cheaper to build with. His clients were getting custom software that would have cost $50,000-$100,000 three years ago, and they were getting it for $15,000.

Now, $15,000 is real money. I'm not going to pretend it's pocket change. But think about it this way.

The HVAC Example

Say you're an HVAC company. You've got 30 crews. You're paying $4,000 a month for ServiceTitan, which is the big enterprise software in that industry. That's $48,000 a year. And you're probably only using 40% of its features, because ServiceTitan is built for companies with 200 crews, not 30.

A custom tool — built for your specific dispatch process, your specific service area, your specific pricing — might cost $15,000 to build and $200/month to maintain. In four months, you've broken even compared to ServiceTitan. After that, you're saving $3,800 a month. That's $45,600 a year, every year.

That's when custom makes sense. Not because it's cool. Not because it's cutting-edge. Because the math works.

Connecting Your Existing Tools: Zapier and Make

Maybe you don't need a full custom application. Maybe you just need your existing tools to talk to each other.

This is what Zapier and Make do. (Make used to be called Integromat, if you've heard that name.) The concept is simple:

When X happens, automatically do Y.

That's it. That's the whole idea. Here are some real examples:

- When someone fills out the contact form on your website → automatically create a contact in your CRM → send them a welcome email → assign them to a salesperson → create a task to follow up in 24 hours.
- When someone leaves a Google review → send you a Slack message (or a text) → if it's negative, create a high-priority task to respond immediately.
- When a new invoice is marked "paid" in QuickBooks → update the customer record in your CRM → send a thank-you email → add them to your "repeat customer" email list.
- When someone books an appointment through your website → add it to your Google Calendar → send a confirmation email → send a reminder text 24 hours before.

Each of these would take a human 2-5 minutes to do manually. If you've got 20 new inquiries a day, that's an hour or two of someone's time just doing data entry and sending emails. Every day. Zapier or Make does it in seconds, automatically, without forgetting or making typos.

The Free Tiers

Both Zapier and Make have free tiers. Zapier's free plan gives you 100 tasks per month with simple two-step automations. Make's free plan gives you 1,000 operations per month. For a

small business just getting started with automation, these free tiers might be enough to test the concept and see if it's worth investing more.

Paid plans start around $20/month for Zapier and $9/month for Make. Not exactly budget-busting.

The Honest Take

Here's where I level with you: these tools are powerful, but they're not as simple as the marketing makes them sound.

The concept is easy — when X happens, do Y. Actually setting it up requires you to understand how your tools connect, what data they share, and how to handle the edge cases. What happens when someone fills out the form but leaves the phone number blank? What happens when the email bounces? What happens when the same person fills out the form twice?

Budget 5-10 hours to learn one of these platforms. Not 30 minutes. Not "just a quick setup." Five to ten hours of watching tutorials, building test automations, breaking things, and fixing them. If that sounds like a lot, remember: you're building a system that will save you hours every week for years. The ROI is there. But the upfront learning is real, and anyone who tells you it takes 15 minutes is selling you something.

If you don't have 5-10 hours and the idea of learning a new software platform makes you want to close this book, that's fine. This is one of the things a consultant can set up for you. (More on that in Chapter 11.)

Custom Apps for Your Specific Workflow

This is the high end. The deep end of the pool. If CRM and automation connectors are the standard tools, custom apps are the specialty equipment.

A custom app is a piece of software built specifically for your business. Not adapted, not configured, not "customized" — built. From scratch. For you.

What This Costs

$5,000 to $15,000 depending on complexity. Possibly more if your needs are genuinely complex, but for most small businesses in Lancaster, that range covers it.

That might sound like a lot. It might sound like a little. It depends on what you're comparing it to.

When It Makes Sense

You're paying for three or four different software subscriptions that don't talk to each other. Your office manager spends two hours a day copying data between systems. You've got a workflow that's specific to your industry — or specific to the way *you* do business — and no off-the-shelf tool handles it well.

Here's a concrete example. Say you run a property management company. You've got:

- A tenant portal (for rent payments and maintenance requests): $150/month
- A separate accounting system: $80/month
- A separate maintenance dispatch tool: $120/month
- Google Sheets for tracking vacancies and showings
- A paper system for lease renewals that someone has to manually check every month

That's $350/month in software that doesn't connect, plus hours of manual work bridging the gaps. A custom app that handles all of it — tenant portal, accounting integration, maintenance dispatch, vacancy tracking, lease management — might cost $12,000 to build and $200/month to run.

Payback period: about a year when you factor in the software savings and the labor savings. After that, it's pure upside.

When It Doesn't Make Sense

You're a three-person business and Excel still works fine. Seriously. If your current system isn't broken — if you're not losing customers, dropping tasks, or wasting hours on manual

work — don't fix it. A custom app is a solution to a real problem, not a status symbol.

I've talked to business owners who want a custom app because they think it'll make them look more professional. It won't. Your customers don't care what software you use. They care whether you show up on time, do good work, and answer when they call.

If your business has fewer than ten employees and your current tools work, the answer is almost certainly: don't build a custom app. Use the free CRM. Set up a couple of Zapier automations. Save your money for something that actually moves the needle.

The Maintenance Reality

I need to end this chapter with the thing nobody wants to hear.

Nothing is "set and forget."

Not your CRM. Not your automations. Not your custom app. Nothing.

Software needs updates. The tools you connect to change their systems. Google updates their API. QuickBooks changes a field name. Your business evolves — you add a service line, you hire more people, you change your pricing structure. All of that means your automations and custom tools need to evolve too.

Budget for this. Seriously. Write it down.

For Zapier/Make automations: plan to spend 1-2 hours per month checking that everything's still running and fixing anything that broke. Or pay someone $100-200/month to do it for you.

For a custom CRM or app: budget $200-500/month for ongoing maintenance and updates. This covers hosting costs, bug fixes, and minor changes as your business evolves. If someone builds you a custom app and says "it's done, you'll never need to touch it again," they're either lying or they don't know how software works.

This isn't unique to AI or custom software, by the way. Your truck needs oil changes. Your storefront needs a new roof every 20 years. Your website needs security updates. Software is the same. It's a living thing that needs care.

The businesses that get burned by custom software aren't the ones who build it. They're the ones who build it, don't maintain it, and then wonder why everything broke six months later. Don't be that business.

The Bottom Line

Here's the decision tree, as simple as I can make it:

If your business has fewer than 50 active customers and a simple workflow: Use HubSpot free or Google Contacts + Sheets. Set up 1-2 Zapier automations. Total cost: $0-20/month.

If your business has 50-500 customers and you're losing track of follow-ups: Get a proper CRM (HubSpot paid tier or similar). Set up 5-10 automations connecting your tools. Total cost: $50-100/month.

If you're paying for multiple software tools that don't connect, and you're wasting hours on manual data transfer: Look into a custom solution. Budget $5,000-15,000 upfront and $200-500/month ongoing. But do the math first — make sure the savings justify the cost.

If Excel still works: Keep using Excel. I'm serious. The best system is the one that works, not the one that's newest.

The goal isn't to have the fanciest tech stack. The goal is to stop losing customers, stop wasting time, and stop paying for things you don't need. Sometimes that means building something custom. Sometimes it means a free tool and a little discipline.

You know your business better than any consultant, any software company, and any book author in Lancaster. Trust that knowledge. Use the tools that solve real problems. Ignore the ones that solve imaginary ones.

Chapter 11: How to Hire an AI Consultant (Without Getting Burned)

Full disclosure: I'm an AI consultant. I live in Lancaster. I would love for you to hire me. And that's exactly why you should read this chapter carefully — including the parts that might talk you out of hiring anyone at all.

I wrestled with whether to include this chapter. It's like a barber writing a chapter on "Do You Really Need a Haircut?" There's an obvious conflict of interest. But I decided the conflict of interest is actually the point. If I can write honestly about hiring consultants — including the reasons not to — while being a consultant myself, that tells you more about how I operate than any sales pitch could.

So here's the deal. I'm going to give you everything you need to evaluate any AI consultant, including me. I'm going to tell you what fair pricing looks like, so nobody can overcharge you. I'm going to tell you the red flags, even the ones I've probably been guilty of at some point. And I'm going to tell you honestly whether you even need a consultant at all.

If you read this chapter and decide to hire someone else — or no one — that's a win. Because it means you made an informed decision, and that's all I ever wanted this book to do.

The Five Questions to Ask Before Paying Anyone

Before you write a check, sit across the table from your potential consultant — or get on a Zoom call, I guess, since half of them don't leave their basement — and ask these five questions. The answers will tell you everything you need to know.

Question 1: "Can you show me this working with a business like mine?"

Not a demo. Not a slideshow. Not a hypothetical case study with the client name conveniently anonymized.

A real business. Like yours. Ideally in your area, ideally in your industry or close to it. A business you could call and ask, "Did this actually work? Was it worth the money?"

If a consultant can't show you a working example with a business like yours, one of two things is true: they've never done this for a business like yours, or the businesses they've done it for weren't happy enough to serve as references. Neither of those is good.

I'm not saying they need to have worked with another Lancaster plumber if you're a Lancaster plumber. But they should have worked with a service business of similar size, with similar challenges, and you should be able to verify that.

Question 2: "What happens when I stop paying you?"

This is the question that separates honest consultants from dependency machines.

When the engagement ends — and it should end at some point — what do you walk away with? Do you own the thing they built? Can it run without them? Is all the data yours? Can another developer pick up where they left off, or is everything locked behind proprietary code that only they can touch?

Or are you renting? Will the voice agent stop working if you cancel? Will the automations break? Will you lose access to your own customer data?

The answer you want: "You own everything. Here's the documentation. Here's how to run it without me. Here are the login credentials for every service. If you want to fire me tomorrow and hire someone else, you can, and nothing breaks."

The answer you don't want: "Well, it's all hosted on our platform, and we manage everything, and you don't really need to worry about the technical details." That's not a service. That's a leash.

Question 3: "What does this cost you to run per month?"

This one makes consultants squirm, and that's how you know it's a good question.

If someone is setting up a voice agent for you and charging you $350/month for ongoing service, you have a right to know what the underlying costs are. The AI model might cost $30-80/month depending on call volume. Hosting might be $10-20. Phone number and telephony might be $20-50. So the hard costs might be $60-150/month, and the rest is their margin for maintenance, monitoring, and support.

That's fine. That's a reasonable margin. They're providing a service — monitoring, fixing issues, updating the system — and they should be compensated for it.

But if someone is charging you $1,500/month and the underlying costs are $75, that's a 95% margin, and they're banking on the fact that you don't know any better. Any honest consultant should be willing to have this conversation. Not necessarily show you an itemized receipt, but give you a straight answer about the general cost structure so you can see that the markup is fair.

If they won't answer this question, or if they get offended that you asked, walk away.

Question 4: "What's your track record? Show me failures, not just wins."

Everyone has a highlight reel. I want to know about the blooper reel.

This is personal for me, so let me just put my cards on the table. I publish my track record. My accuracy rate is 42%. That means more often than not, my predictions about what will work don't pan out. I publish the misses alongside the wins because I think that's the only honest way to operate.

Now, 42% might sound terrible. "Why would I hire someone who's wrong 58% of the time?" Fair question. Here's the answer: the 42% that works generates enough value to more than cover the 58% that doesn't. And more importantly, I know my accuracy rate. I've measured it. I've published it. I can tell you exactly which types of projects tend to work and which ones are coin flips.

A consultant who tells you everything they touch turns to gold is lying. AI is new. The applications are new. Nobody has a 90% hit rate. If they claim to, they're either not measuring, not counting the failures, or not doing enough work to have a meaningful sample size.

What you want is someone who knows what they don't know and is honest about the uncertainty. Someone who says, "Here's what I think will work, here's why, and here's what we'll do if it doesn't."

Question 5: "Will I own this, or do I rent it from you?"

This is important enough that I'm hitting it twice — once in Question 2 and again here — because it's the single most common way small businesses get burned by tech consultants of any kind, not just AI.

The answer should be: you own it. Period.

Your data. Your accounts. Your code. Your system. If they built you a custom app, you should have the source code. If they set up automations, you should have admin access to every account. If they trained an AI on your business data, that trained model should be yours.

"But Leo, if I own it all, what's to stop me from firing the consultant and doing it myself?"

Nothing. That's the point. The consultant should be confident enough in the value they provide that they don't need to hold your data hostage to keep you. If their only leverage is that you can't leave, they're not providing enough value for you to want to stay.

Red Flags: When to Walk Away

Here's my list. I've seen every one of these in the wild. Some of them I've probably been guilty of in my early days, which is how I know they're red flags.

They learned AI six months ago and now they're "experts." The AI gold rush has created a lot of overnight experts. Someone watched a few YouTube videos, set up a ChatGPT account, and now they're charging businesses $5,000 to "implement AI solutions." Ask how long they've been building with AI — not using it, building with it. There's a difference between someone who's used ChatGPT to write emails and someone who's built custom AI systems. If their entire experience is from 2024 or later, be cautious.

They use jargon to make you feel stupid. "We'll implement a RAG-based architecture with fine-tuned embeddings on your proprietary data lake." If you hear something like that and your eyes glaze over, it's not because you're dumb. It's because they're trying to make simple things sound complicated so you feel like you need them. Any concept in AI can be explained in plain English. If they won't do that, it's because the plain English version would make you realize it's not as complex or as valuable as they're implying.

They won't break down their costs. I covered this above. Transparency about pricing isn't optional. It's a baseline requirement for trust.

They promise specific revenue increases they can't substantiate. "This AI system will increase your revenue by 30%." No, it won't. Or maybe it will. They don't know. Nobody knows until it's running. They can make projections based on assumptions — "If we capture 20% of the calls you're currently missing, and your average job is $500, that's X dollars per month" — and those projections can be reasonable. But a guarantee? A specific number? That's a sales tactic, not an analysis.

They want a long-term contract before proving value. A twelve-month commitment before they've delivered anything is a red flag the size of a barn. The honest version: a small paid pilot, maybe 30-60 days, after which you both evaluate whether it's working. If it's working, you continue. If it's not, you part ways. Anyone who needs a long contract to lock you in doesn't trust that their work will speak for itself.

They don't have any local clients or references you can actually call. This one matters more than people think. AI consultants are everywhere now — most of them remote, most of them in some city you've never visited. There's nothing inherently wrong with remote work. But if someone has zero clients in your area, zero references you can talk to face-to-face, and zero understanding of what a small business in Lancaster, Ohio actually looks like day to day, that's a gap. Not a dealbreaker, maybe. But a gap.

Green Flags: Signs You Found a Good One

They can demo live with your data. Not a pre-recorded demo. Not screenshots. They take your actual business information — your menu, your services, your FAQ, whatever — and they show you the system working with it in real time. If it stumbles, they don't hide it. They show you the stumble and explain how they'd fix it.

They explain everything in plain English. You should leave every meeting understanding what they're going to build, how it works, what it costs, and why. If you feel confused after a meeting with a consultant, that's their failure, not yours.

They tell you what AI can't do for your business. This is the big one. An honest consultant should spend almost as much time talking about limitations as capabilities. "AI can handle your routine calls, but it's going to struggle with complex complaints — those should still go to a person." "This automation will work for your standard workflow, but the edge cases will need manual handling." If everything they say is positive, they're selling, not consulting.

They offer a small paid pilot before a big commitment. Notice I said "paid," not "free." A free pilot means they're desperate. A paid pilot means they value their time but they're confident enough to let you test the water before diving in. A pilot might be $500-1,500 for a limited implementation that runs for 30 days. At the end, you both look at the data and decide whether to continue.

They have a physical presence or clear reputation in your area. They show up to the Lancaster Chamber of Commerce meetings. They have other local clients. People in town know who they are. This isn't about being anti-remote. It's about accountability. Someone who lives in your town and does business in your town has a reputation to protect. That's a form of insurance you don't get with someone working from a laptop in a city a thousand miles away.

What Fair Pricing Looks Like

I'm about to do something that might annoy other AI consultants: I'm going to tell you what things should cost.

Voice agent setup: $1,500 to $3,000. This covers building the agent, training it on your business information, testing it, and launching it. If someone is quoting you $10,000 for a voice agent setup, they're either building something far more complex than most businesses need, or they're overcharging. Ask why.

Voice agent monthly service: $200 to $350. This covers the AI costs, telephony, hosting,

monitoring, and basic ongoing adjustments. The underlying hard costs are probably $60-150 of that, and the rest is their margin for support and maintenance. That's fair.

Custom automation (Zapier/Make setup): $2,500 to $10,000 depending on scope. A simple three-step automation connecting your website form to your CRM to your email? That's toward the low end. A complex ten-step workflow with error handling, conditional logic, and multiple integrations? That's toward the high end.

Custom app: $5,000 to $15,000. A simple custom CRM or workflow tool is on the low end. A multi-feature application with a customer-facing portal, integrations, and mobile access is on the high end.

Monthly retainer for ongoing support: $250 to $500. This is for the consultant to be available when things break, make minor adjustments, and keep things running smoothly.

Now. If someone is charging five times these numbers — $15,000 for a voice agent setup, $1,500/month for service, $75,000 for a custom app — they're banking on your ignorance. They're betting you don't know what things cost. Now you do.

Are there legitimate reasons for higher pricing? Sometimes. Complex enterprises, heavy customization, regulated industries with compliance requirements. But for a small business in Lancaster? These ranges should cover it.

The Honest Truth About DIY

Here's where I talk myself out of some business.

Chapters 3 through 8 of this book cover what 80% of small businesses need. ChatGPT for daily tasks. A voice agent to answer phones. Social media assistance. Basic automation. If you followed those chapters — actually did the work, not just read them — you may not need a consultant at all.

Let me say that again, because it's important: you may not need a consultant at all.

The 80% path looks like this: you sign up for ChatGPT ($20/month), you set up a voice agent through one of the platforms I recommended (maybe $50-100/month), you use the free tier of a CRM, and you build a couple of Zapier automations. Total cost: under $200/month. Total time to set up: maybe 15-20 hours spread over a few weeks. No consultant required.

That leaves the 20%. The businesses that have genuinely complex needs. Who are they?

High phone volume businesses. If you're getting 50+ calls a day, the setup is more complex. You need proper call routing, overflow handling, integration with scheduling systems, and careful monitoring. This is hard to DIY well.

Multi-location operations. If you've got three locations with different hours, different services, and different staff, the complexity multiplies. The voice agent needs to know which location the caller wants. The CRM needs to track customers across locations. The automations need to route to the right people.

Specific workflow problems that off-the-shelf tools don't solve. This is the HVAC company with 30 crews, the property management company with 200 units, the medical office with compliance requirements. If your workflow is genuinely unique and no existing tool handles it well, that's when custom development makes sense — and custom development usually means hiring someone.

Businesses where the owner's time is the bottleneck. If you're a solo practitioner billing $300/hour, spending 20 hours setting up AI tools yourself costs you $6,000 in lost revenue. Paying a consultant $3,000 to do it in a week is the smarter math. This isn't about capability — you're probably smart enough to do it yourself. It's about the economics of your time.

If you don't fall into one of those categories, save your money. I mean that. I would rather you read this book and never call me than call me for something you could have done yourself in an afternoon. That's not false modesty. It's just math. If I help you with something you didn't need help with, I've taken your money for no good reason, and eventually you'll figure that out, and then I've lost something worth more than the fee: your trust.

How to Structure the Engagement

If you've decided you do need a consultant, here's how to structure it so you're protected.

Start with a paid assessment. $500-1,000 for the consultant to evaluate your business, your current tools, your workflow, and your actual needs. At the end, they give you a written recommendation: here's what I'd suggest, here's what it costs, and here's the expected outcome. You can take that recommendation and implement it yourself, hire them, or hire someone else. The assessment should be valuable on its own, whether or not you continue.

Do a pilot. Whatever they recommend, start small. If they want to build a voice agent, do one phone line first, not all of them. If they want to build a custom app, start with the core feature, not the whole wishlist. Run it for 30-60 days. Measure the results against what they projected.

Set clear milestones. Not "we'll have it done in a few months." Specific dates, specific deliverables. "By week two, the voice agent is trained and running in test mode. By week four, it's live on one line. By week eight, we evaluate performance and decide on expansion." If they miss milestones, you know early.

Get everything in writing. What they're building. What it costs. What you own. What happens if it doesn't work. What the ongoing costs are. I know this sounds basic. You'd be amazed how many business owners skip this step with tech consultants because the technology feels complicated and they figure the consultant knows best. Get. It. In. Writing.

Plan the exit from day one. The engagement should have a natural end point. Not "we'll keep supporting you indefinitely." A specific plan for when and how the consultant walks away and your business keeps running.

Which brings me to the most important part of this chapter.

Train Someone Inside Your Business

Here's what I think the best version of an AI consulting engagement looks like — and it's different from what most consultants will tell you, because it means they make less money.

Instead of building a system and then charging you $250/month forever to maintain it, the consultant should train someone who already works for you to run it. Modify it. Improve it. Own it.

Think about what that does for everyone involved.

For you, the business owner: You're not renting expertise. You're buying a transfer of capability. When the consultant leaves, the knowledge stays inside your building. You're not one canceled subscription away from your systems falling apart.

For your employee: The person you pick for this just learned the most in-demand skill in the economy. They became more valuable — not just to you, but to every employer. That's a raise waiting to happen. That's a reason to stay at your company instead of leaving for somewhere that offers more. You didn't just solve an AI problem. You created a retention tool.

For the consultant: This is the part most consultants won't tell you, because it sounds like bad business. It's not. Here's why. In a town like Lancaster — or any town where everyone knows everyone — the employee I train becomes my best referral source. They go to a Chamber event. Someone asks, "How did you guys get that voice agent working?" They say, "Leo set it up and trained me to run it." That's worth more than twelve months of maintenance fees.

Here's what this looks like in practice:

The training engagement: Instead of a monthly retainer that goes on forever, the engagement has three phases. Phase one: I build the system and get it running. Phase two: I work alongside your designated person, showing them everything — how it works, how to modify it, what to do when something breaks, and when to call me. Phase three: they run it solo for 30 days while I'm available for questions. After that, I'm done. They own it.

Who to pick: You want someone who's curious, not necessarily technical. The person on your team who's always the first to figure out the new software. The one who Googles things instead of asking. They don't need a computer science degree. They need to be willing to learn and not afraid of breaking things.

The incentive alignment: Here's the part I want you to really hear. If you train your office manager to run your AI systems and they get good at it, they're going to know they're worth more. And they are. The right move is to pay them more — because what they're doing is saving you money that used to go to the consultant, saving you time, and making the business more efficient. Pass some of that savings along. That's how you keep them.

This creates a cycle that benefits everyone: the business gets more capable, the employee gets more valuable and better compensated, and the consultant gets referrals from someone who actually understands what was built. Nobody is dependent on anyone. Everyone wins.

What to ask a consultant: "Is your plan to train someone on my team to maintain this, or is your plan to maintain it yourself?" If the answer is the latter, ask why. Sometimes there's a legitimate reason — maybe nobody on your team has bandwidth, or the system is genuinely complex. But most of the time, the real reason is that recurring revenue is more profitable than training engagements. And that's their incentive, not yours.

The Final Word

The best AI consultant is one who makes themselves unnecessary as fast as possible.

I don't mean that as a platitude. I mean it as a business model. Come in, build the thing, train someone to run it, and leave. Collect a fair fee for your expertise. Get referrals from the people you trained. Move on to the next business.

If someone is building a dependency — if their business model requires you to keep paying them forever because nothing works without them — they're building their business, not improving yours.

The good ones come in, build something that works, put the knowledge in the hands of someone on your team, and walk out the door knowing the business is better off. Maybe you call them when you're ready for the next phase. Maybe you don't. Either way, the system runs without them. Your data belongs to you. Your employee knows how to maintain it. Your business is more capable than it was before.

That's the standard. Don't settle for less.

And look — if you read this whole chapter and decided you don't need to hire anyone, including me, then this chapter did its job. Go back to Chapter 3, start implementing, and keep your money in your pocket.

The best tool is the one that solves your problem. Sometimes that's a $20/month subscription. Sometimes it's a $15,000 custom app. And sometimes it's a book written by a guy in Lancaster who just wanted to make sure you didn't get ripped off.

Part Five: The Lancaster Appendix

Chapter 12: AI for Fairfield County — The Lancaster Appendix

I could have written this book for "small businesses everywhere." I didn't. I wrote it for you, specifically, because I live here.

I drive past your businesses on my way to get coffee. My kids go to school in this district. I pay property taxes in Fairfield County. When I talk about "Main Street," I mean the actual Main Street — the one with the courthouse, the one where you can still parallel park for free if you know where to look.

Every other AI book on the market right now is written by someone in San Francisco, New York, or Austin. They write about "small businesses" the way a travel writer describes a city they visited for a weekend. They get the broad strokes right and every important detail wrong.

This chapter is the one that would be impossible for them to write. Because this chapter is about you. Your town. Your customers. Your specific situation.

Why Local Matters More Than You Think

Here's something the tech industry doesn't understand: trust is geographic.

Your customers don't come to you because you're the cheapest option on the internet. They come to you because they know you. Because their neighbor recommended you. Because

you sponsored their kid's little league team. Because when something went wrong, you picked up the phone and made it right.

That same principle applies to who you trust with your business technology.

A national AI consultant can get on a Zoom call and tell you about "transformative solutions" and "paradigm shifts." They'll have great slides. They might even have a reasonable price. But they don't know that half your customers are on well water. They don't know that your busy season starts when Ohio State football ends. They don't know that the Fairfield County Fair is worth more to your bottom line than any Black Friday sale.

The person who understands your business AND understands AI is worth more than any tool. Tools are commodities. Understanding is not.

I'm not saying you need to hire a local person for everything. I'm saying that when you're figuring out how AI fits into your specific business, context matters. A lot. The prompts I've given you throughout this book work anywhere. But the strategy — how you deploy them, what you prioritize, what your customers actually need — that's local knowledge. And local knowledge is your competitive advantage.

Nobody on the internet can replicate what you know about serving customers in Fairfield County. AI is just the tool that lets you use that knowledge more efficiently.

Lancaster Businesses and AI: Specific Opportunities

I've organized this section by the types of businesses I actually see operating here. Not theoretical categories from a business school textbook. Real businesses that real people run in this county.

HVAC, Plumbing, and Electrical Contractors

You're busy. Probably too busy to read this book, honestly, so I appreciate you getting this far.

Your biggest AI opportunities are on the phone and in the truck. Voice agents can answer your calls when you're elbow-deep in a furnace repair. Not a voicemail. Not "press 1 for scheduling." An actual AI agent that can book appointments, give basic pricing ranges, and capture the caller's information so you can follow up.

Estimate automation is the other big one. You already know what a standard water heater install costs. You know the variables — access, code requirements, disposal. An AI system that takes your inputs and generates a professional, branded estimate in 30 seconds instead of 30 minutes? That's not futuristic. That's available right now.

Scheduling optimization is the third piece. When you're routing three trucks across Fairfield County, the difference between good routing and bad routing is an hour of windshield time per day. Multiply that by five days a week. That's real money.

Restaurants and Food Trucks

Social media is probably the thing you know you should be doing but don't have time for. AI can batch your social media posts. Take one good photo of today's special, feed it to an AI with your restaurant's voice, and get a week's worth of posts in five minutes.

Menu optimization is underrated. AI can analyze your sales data — even if your "sales data" is just a notebook — and tell you which items are making money and which are taking up menu space. If your food cost on the fish tacos is 45% and nobody orders them on weekdays, you don't need AI to tell you to cut them. But AI can help you see patterns across your whole menu that you might miss when you're in the weeds every night.

Review management is the third one. Responding to Google reviews matters. A lot. AI can draft responses in your voice — grateful for the good ones, measured and professional for the bad ones. You still approve everything before it posts. But the draft is done in seconds instead of you staring at your phone at 11 PM trying to sound professional when someone complained about your parking lot.

Professional Services — Attorneys, Accountants, Financial Advisors

Document drafting is the obvious one. First drafts of standard documents, client letters, engagement agreements. Your judgment and expertise are still doing the real work. AI is just

handling the typing.

Client communication is where it gets interesting. Regular check-in emails, appointment reminders, educational content for your clients. The accountant who sends a useful tax tip email every month gets more referrals than the one who only contacts clients in March. AI makes being that accountant easy instead of another thing on your to-do list.

Intake automation is the most immediately valuable for most professional service firms. A potential client fills out an online form. AI processes the information, drafts a preliminary assessment, and prepares a summary for you before the first meeting. You walk in already informed. The client feels like you care. Because you do — you just also used a tool to care more efficiently.

Retail — Main Street and Beyond

Product descriptions for your website or online store. If you have 200 products and each one needs a description, that's a week of writing or 90 minutes with AI. Not even a close call.

Inventory management gets smarter with AI analyzing your sales patterns. What sells before the Fairfield County Fair? What moves in December but sits on shelves in February? You probably know this intuitively. AI can confirm your intuition or challenge it with data.

Google Business Profile optimization is free and matters enormously. AI can help you write better descriptions, generate post content, draft responses to questions, and keep your profile active. An active Google Business Profile with regular posts and review responses ranks higher than a dormant one. That's free visibility.

Healthcare and Wellness Practices

Appointment scheduling and patient communication are the bread and butter. Missed appointments cost you money. AI-powered reminder systems with smart rescheduling reduce no-shows. Simple as that.

Insurance FAQ handling is a hidden time sink. Your front desk staff answers the same 15 insurance questions every day. An AI system — even just a well-organized chatbot on your website — can handle the routine questions so your staff can focus on patients who are actually standing in front of them.

Patient communication between visits — follow-up care instructions, wellness tips, appointment prep information — builds the kind of relationship that keeps patients coming back. AI makes it feasible to maintain that communication at scale without hiring another person.

Agriculture and Agri-Business

Market analysis for crop pricing and timing. AI can process commodity data, weather forecasts, and regional trends faster than any human. It won't replace your experience, but it'll give your experience better data to work with.

Compliance documentation is a headache for every farmer I've ever talked to. AI can help draft and organize the paperwork that comes with modern agriculture — from USDA requirements to state-level reporting. It won't fill out the forms for you, but it'll get you 80% of the way there.

Weather-based planning is one of those areas where AI genuinely adds new capability. Not just "what's the forecast" but "given this forecast pattern, here's the optimal planting window for your specific location and crop mix." That level of analysis used to require a consultant or a lucky guess. Now it requires a good prompt.

Construction and General Contractors

Estimate templates that learn from your actual project history. The more estimates you feed into an AI system, the better it gets at predicting costs for your specific market. National estimating databases don't account for Fairfield County labor rates and material availability. Your data does.

Project documentation — daily logs, progress reports, change orders — is the kind of writing that has to happen but nobody wants to do. AI can turn your voice memos and job site photos into professional documentation. Talk into your phone on the drive home, and have a formatted daily report in your email by the time you walk in the door.

Permit tracking and compliance follow-up. Every municipality has different requirements. AI won't navigate the Fairfield County permit office for you — you still need to show up — but it can keep track of deadlines, required inspections, and documentation so nothing falls through the cracks.

Local Resources You Should Actually Know About

These are real organizations with real people who can help you. I verified every address and phone number. If something's changed since publication, that's on the passage of time, not on me making things up.

Lancaster Fairfield County Chamber of Commerce 109 N Broad Street, Suite 100, Lancaster, OH 740.653.8251 cheryl@lancoc.org lancoc.org

The Chamber is the hub. If you're not a member, you're missing networking opportunities, business development resources, and a group of people who genuinely want to see Lancaster businesses succeed. They're not an AI resource specifically, but they're a business resource, and AI is a business tool.

SCORE Central Ohio score.org

Free business mentoring from people who've actually run businesses. SCORE mentors can't necessarily help you set up an AI voice agent, but they can help you think through whether you should. Business strategy first, technology second. Always.

Ohio State University Extension — Fairfield County 831 College Ave, Suite D, Lancaster, OH 740.653.5419

Particularly relevant for agricultural businesses, but Extension offers business resources, educational programs, and connections that go beyond farming. Worth a call even if you don't think they're "for you."

Ohio Small Business Development Center ohiosbdc.org

Free and low-cost consulting for small businesses. They help with business plans, market research, and financial analysis. Again, not AI-specific, but the kind of foundational business support that makes AI investments smarter.

OhioMeansJobs Fairfield County

Workforce development resources. If AI is changing what skills you need in your employees — and it probably is — this is a place to find training resources and candidates.

Young Professionals of Fairfield County (YPFC) Through the Chamber

If you're under 40 and running a business or thinking about it, this is your network. These are the people who'll be running Lancaster in 20 years. The relationships you build here are worth more than any AI tool.

A Personal Note to Close

I want to be honest about who's writing this.

I'm not wealthy. I have about $150,000 in student debt. I've never had a venture-backed exit or a Silicon Valley pedigree. I have a wife and kids and a mortgage. I've built AI systems with a 42% track record — which means I've been wrong more than I've been right, and I'm still standing. That's not a brag. That's just what it looks like when you keep showing up.

I started MetaSPN because I believe AI can be useful for regular people, not just tech companies with seven-figure budgets. I wrote this book because I believe the biggest opportunity in AI isn't in Silicon Valley. It's on Main Street. It's in towns like Lancaster where real people run real businesses and solve real problems for their neighbors.

The tech industry has a tendency to talk about small towns like they're problems to be solved. I don't see it that way. I see Lancaster as a place where people know how to work, know how to take care of each other, and know how to be skeptical of anyone who shows up promising miracles. That skepticism is a feature, not a bug. It's going to serve you well as AI hype continues to get louder.

Use what's useful in this book. Ignore what's not. Try things. Break things. Ask questions.

My email is Leo@aiforlancaster.com. If this book helped, tell me. If you think I got

something wrong, tell me that too. I'd rather hear from you than not.

And if you need help with something this book didn't cover, I'm 10 minutes away.

That's the whole point.

Appendices

Appendices

Appendix A: The Prompt Library

These are copy-paste prompts. They work in ChatGPT, Claude, Gemini, or any other general-purpose AI tool. Customize the parts in [brackets] with your actual information.

I've organized them by what you're trying to do, not by what tool you're using. A good prompt works everywhere.

Customer Communication

1. Professional Response to a Positive Review

> I own [type of business] in Lancaster, Ohio called [business name]. A customer left this positive review: "[paste review]". Write a warm, professional response that thanks them specifically for what they mentioned, feels genuine and not corporate, and is under 75 words.

2. Professional Response to a Negative Review

> I own [type of business] in Lancaster, Ohio called [business name]. A customer left this negative review: "[paste review]". Write a response that acknowledges their frustration without being defensive, offers to make it right, and invites them to contact me directly at [phone/email]. Keep it under 100 words and professional but human.

3. Appointment Reminder Email

> Write a friendly appointment reminder email for [type of business]. The appointment is [service type] on [date] at [time]. Include: what to bring or prepare, parking/location notes for [address], cancellation policy of [policy], and a warm but professional tone. Keep it under 150 words.

4. Follow-Up After Service

> Write a follow-up email to send 2 days after completing [type of service] for a customer. Thank them, ask if everything is working/looking good, remind them of any warranty or follow-up care, and gently ask for a Google review with this link: [link]. Keep it friendly, not pushy. Under 100 words.

5. Estimate Follow-Up for Non-Responders

> Write a follow-up email for a customer who received an estimate from my [type of business] 5 days ago but hasn't responded. Be helpful, not salesy. Acknowledge they may be comparing options. Offer to answer questions. Don't pressure them. Under 100 words.

6. Seasonal Check-In Email

> Write a seasonal check-in email from my [type of business] for [season — spring/summer/fall/winter]. Mention one relevant seasonal tip related to our services, remind them we're available if they need anything, and keep it genuinely helpful rather than a sales pitch. Under 125 words.

7. New Customer Welcome Email

> Write a welcome email for a new customer of my [type of business] called [business name]. Include: a thank you for choosing us, what to expect going forward, how to reach us [phone/email/hours], and one thing that makes us different from competitors: [differentiator]. Warm and professional. Under 150 words.

8. Payment Reminder — Friendly First Notice

> Write a friendly payment reminder for an invoice that's [number] days past due. The amount is [amount] for [service provided] on [date]. Keep it polite and assume it was an oversight. Include payment options: [list payment methods]. Under 75 words.

9. Referral Thank-You Note

> Write a short thank-you note for a customer who referred someone to my [type of business]. Mention the referral by first name: [name]. Express genuine gratitude. If we have a referral incentive of [incentive], mention it naturally. Under 75 words.

10. Service Unavailability / Waitlist Communication

> Write an email to a customer letting them know that [service/product] is currently unavailable and we expect it back by [timeframe]. Offer to put them on a waitlist. Suggest an alternative if applicable: [alternative]. Be apologetic but not groveling. Under 100 words.

Marketing & Social Media

11. Weekly Social Media Batch — Facebook/Instagram

> I own [type of business] in Lancaster, Ohio. Generate 5 social media posts for this week. Include: one behind-the-scenes post, one customer-focused tip, one seasonal/timely post, one light/fun post that shows personality, and one that highlights a specific service or product: [service/product]. Keep each post under 50 words. Suggest a photo idea for each.

12. Google Business Profile Weekly Post

> Write a Google Business Profile post for my [type of business] called [business name] in Lancaster, Ohio. This week's focus: [topic — seasonal service, promotion, tip, event]. Include a call to action. Keep it under 100 words. Make it sound like a real person wrote it, not a marketing agency.

13. Email Newsletter Draft

> Write a short email newsletter for my [type of business]. This month's content: [1-2 topics]. Include a brief intro, the main content broken into scannable sections, and a simple call to action. Target length: 200-300 words. Tone: helpful and conversational, like writing to a neighbor.

14. Local Event Tie-In Post

> My [type of business] in Lancaster, Ohio wants to create a social media post tied to [local event — Fairfield County Fair, Lancaster Festival, Pilgrimage, etc.]. Write a post that connects our business to the event naturally without being forced. Under 50 words.

15. Before/After Project Showcase

> Write a short social media caption for a before/after photo of [project type] we completed. Mention the challenge, what we did, and the result. Keep it under 60 words. End with something that invites engagement without saying "like and share."

16. FAQ Post Series

> I get asked "[common question]" all the time at my [type of business]. Write a social media post that answers this question in plain language. Make it helpful enough that someone would save or share it. Under 75 words.

17. Seasonal Promotion Announcement

> Write a social media post announcing [promotion details] at my [type of business]. Include: what the offer is, when it expires, how to take advantage of it, and why we're running it (be honest — slow season, new service launch, customer appreciation, etc.). Under 75 words.

18. Staff Spotlight Post

> Write a social media post spotlighting [employee name] who works at my [type of business]. They've been with us [duration] and their role is [role]. One fun or interesting fact about them: [fact]. Make it warm and genuine. Under 60 words.

19. Community Involvement Post

> My business [business name] recently [sponsored/volunteered at/donated to] [community event or organization]. Write a social media post about it that focuses on the community, not on us. Mention what the event/organization does and why it matters. Under 75 words.

20. Service Explainer Post

> Many of my customers don't fully understand [service or process]. Write a social media post that explains it simply. Use an analogy if it helps. The goal is education, not selling. Under 75 words.

Operations & Admin

21. Standard Operating Procedure Draft

> Write a standard operating procedure (SOP) for [task/process] at my [type of business]. Steps should be numbered, clear enough for a new employee to follow, and include any safety or quality checkpoints. Current process in my own words: "[describe your process roughly]". Format it professionally.

22. Meeting Agenda Template

> Create a meeting agenda for a [duration]-minute [type of meeting — staff, planning, review] at my [type of business]. Topics to cover: [list topics]. Include time allocations for each item and an "action items" section at the end.

23. Customer Complaint Documentation

> Help me document a customer complaint for our records. Here's what happened: "[describe situation]". Format this as a formal incident report with: date, customer info, nature of complaint, what we did to resolve it, outcome, and any follow-up needed.

24. Vendor Comparison Summary

> I'm comparing [number] vendors for [product/service]. Here are the details for each: [list what you know — price, terms, pros, cons]. Organize this into a clear comparison with a recommendation based on [your priorities — price, quality, reliability, local, etc.].

25. Job Task Checklist

> Create a daily task checklist for a [job title] at my [type of business]. They're responsible for [list general responsibilities]. Break this into opening tasks, mid-day tasks, and closing tasks. Make it specific enough to be useful, not so detailed it's patronizing.

26. Email Template for Vendor Communication

> Write a professional email to a vendor/supplier about [topic — late delivery, price increase question, new order, quality issue]. My situation: [describe briefly]. Keep it firm but fair. I want to maintain the relationship. Under 150 words.

27. Policy Draft

> Write a draft [type of policy — return policy, cancellation policy, employee PTO policy, etc.] for my [type of business]. Key details: [list the terms you want]. Make it clear and readable for [audience — customers, employees]. Avoid legal jargon but be specific enough to prevent misunderstandings.

28. Training Outline for New Hires

> Create a first-week training outline for a new [job title] at my [type of business]. They need to learn: [list key skills/tasks]. Break it into Day 1-5 with specific goals for each day. Include who they should shadow and what they should be able to do

> independently by Friday.

29. Inventory Count and Order Template

> Create a simple inventory tracking template for [type of inventory] at my [type of business]. Categories: [list categories]. Include columns for: item, current count, minimum threshold, order quantity, supplier, and last order date. Format as a table I can print or put in a spreadsheet.

30. End-of-Year Business Review Prompts

> I own a [type of business] in Lancaster, Ohio. Help me do an end-of-year review. Ask me 10 specific questions about how my business performed this year — revenue, customers, operations, marketing, employees, and goals. After I answer, help me identify the 3 most important things to focus on next year.

Hiring & HR

31. Job Posting Draft

> Write a job posting for a [job title] at my [type of business] in Lancaster, Ohio. The role involves: [key responsibilities]. Requirements: [list them]. Pay range: [range]. What makes working here good: [honest selling points — not ping pong tables, real things]. Keep it straightforward and honest.

32. Interview Questions for a Specific Role

> Generate 10 interview questions for a [job title] position at my [type of business]. Mix behavioral questions ("tell me about a time…") with practical ones specific to the role. Skip the generic "what's your greatest weakness" stuff. I want questions that actually reveal whether someone can do this job.

33. Employee Review Talking Points

> I need to do a performance review for an employee in the role of [job title]. Their strengths: [list]. Areas for improvement: [list]. Help me structure talking points that are honest, specific, and constructive. I want to be fair and clear, not vague. Include 2-3 specific goals for the next review period.

34. Rejection Email — After Interview

> Write a brief, respectful rejection email for someone who interviewed for [position] at my business. They [mention something specific positive about their interview if applicable]. I want to be honest and kind without giving false hope or legal exposure. Under 75 words.

35. Job Offer Email

> Write a job offer email for [candidate name] for the position of [job title] at [business name]. Include: start date, pay rate of [amount], schedule of [hours], who they report to, and what to bring on day one. Be welcoming but clear on the details. Under 150 words.

Financial & Estimates

36. Basic Estimate Template

> Create a professional estimate template for my [type of business]. Services provided: [list services with rough price ranges]. Include: line items, quantities, unit prices, subtotal, tax if applicable, total, payment terms of [terms], and an expiration date of [timeframe]. Format it cleanly.

37. Price Increase Communication

> Write an email announcing a price increase to my customers. My [type of business] is raising prices on [services/products] by [amount/percentage] starting [date]. The reason: [honest reason — material costs, labor, inflation, etc.]. Keep it factual, not apologetic. Remind them of the value they get. Under 150 words.

38. Monthly Financial Summary Template

> Create a template for a monthly financial summary I can fill in for my [type of business]. Include sections for: revenue (by category if applicable), expenses (fixed and variable), net profit, notable changes from last month, cash flow notes, and one action item for next month. Keep it to one page.

39. Collections Email Series

> Write a 3-email sequence for collecting on past-due invoices. Email 1: 15 days past due (friendly reminder). Email 2: 30 days past due (firmer, mentions payment options). Email 3: 60 days past due (final notice, mentions next steps). Keep each professional and under 100 words. My business is [type of business].

40. Profit Margin Calculator Prompt

> I sell [product/service] for [price]. My costs are: [list all costs — materials, labor, overhead allocation]. Help me calculate my gross profit margin and net profit margin. Then tell me what margin is typical for [industry] and whether I'm above, below, or at industry average. Suggest one specific way to improve margin if I'm below average.

Strategy & Planning

41. Competitive Analysis

> I run a [type of business] in Lancaster, Ohio. My main competitors are [list 2-3 competitors or describe them generally]. Help me identify: what they do well, what they might be missing, and where I have an opportunity to differentiate. Be specific and honest — I don't need flattery, I need clarity.

42. 90-Day Business Priority Plan

> I own a [type of business]. Here's what's going on right now: [describe your current situation — busy, slow, growing, struggling, launching something new]. Help me identify the 3 most important things to focus on in the next 90 days. For each one, give me a specific first step I can take this week.

43. Customer Persona Development

> Help me define my ideal customer for my [type of business] in Lancaster, Ohio. I'll describe who I think my best customers are: [describe them]. Ask me follow-up questions to sharpen this, then write a one-paragraph customer persona I can use to guide my marketing decisions.

44. SWOT Analysis

> Conduct a SWOT analysis for my [type of business] in Lancaster, Ohio. Here's what I know: Strengths: [list]. Weaknesses: [list]. I need help identifying Opportunities and Threats specific to my industry and location. Be practical, not theoretical.

45. New Service/Product Evaluation

> I'm thinking about adding [new service or product] to my [type of business]. My reasoning: [why you're considering it]. Help me think through: startup costs, time investment, impact on existing operations, target customer, competitive landscape, and a realistic timeline to profitability. Be blunt if it sounds like a bad idea.

Google Business Profile

46. Business Description Optimization

> Write an optimized Google Business Profile description for my [type of business] called [business name] in Lancaster, Ohio. We specialize in [specialties]. What makes us different: [differentiators]. Our service area includes [areas]. Keep it under 750 characters. Include relevant keywords naturally — don't stuff them.

47. Google Business Profile Q&A Preload

> Generate 10 frequently asked questions and answers for my [type of business] Google Business Profile. Include questions about: hours, pricing (general), service area, scheduling, what to expect, and parking/location. Answers should be brief, helpful, and accurate based on this information: [provide your details].

48. Weekly GBP Post — Service Highlight

> Write a Google Business Profile post highlighting our [specific service] at [business name] in Lancaster, Ohio. Mention who this service is for, why customers choose us for it, and a clear call to action (call, visit, book online). Under 100 words. Include a suggested photo description.

49. GBP Post — Seasonal Tip

> Write a Google Business Profile post with a helpful [season] tip related to [your industry]. Example: a heating company posting furnace maintenance tips in fall. Be genuinely useful. Mention that we're available to help if needed but don't make the whole post a sales pitch. Under 100 words.

50. GBP Response to a Question

> A potential customer asked this question on our Google Business Profile: "[paste question]". Write a helpful, professional answer that addresses their question directly, provides useful additional information, and gently directs them to contact us if they need more details. Under 75 words.

Appendix B: The AI Tool Comparison Chart

This chart was accurate as of the time of writing. Prices change. Features change. Free tiers appear and disappear. Use this as a starting point, not a permanent reference. Check current pricing before you buy anything.

Learning Curve: 1 = anyone can use it immediately. 5 = you'll need to invest real time learning.

Tool	What It Does	Free Tier?	Paid Price (approx/mo)	Best For	Learning Curve
ChatGPT	General AI assistant — writing, research, analysis, coding, brainstorming	Yes (GPT-3.5)	$20/mo (Plus)	General business writing, first AI tool to try	1
Claude	General AI assistant — writing, analysis, longer documents, nuanced work	Yes (limited)	$20/mo (Pro)	Longer documents, detailed analysis, thoughtful writing	1
Gemini	Google's AI assistant — integrated with Google Workspace	Yes (basic)	$20/mo (Advanced)	Businesses already deep in Google ecosystem	2
Canva	Graphic design — social posts, flyers, presentations, logos	Yes (limited)	$13/mo (Pro)	Social media graphics, basic marketing materials	2
Monologue (via Every)	Voice dictation + transcription, adapts to your vocabulary	No (included w/ Every)	$20/mo (Every sub)	Voice memos, meeting notes, dictation in any app	1
Cora (via Every)	AI email assistant — screens inbox, summarizes, drafts replies in your voice	No (included w/ Every)	$20/mo (Every sub)	Email overload, inbox management, response drafting	1

Tool	What It Does	Free Tier?	Paid Price (approx/mo)	Best For	Learning Curve
Every (every.to)	in your voice reporting + bundled tools (Monologue, Cora, etc.)	No	$20/mo	Staying informed on real AI business use cases	1
Mailchimp	Email marketing — newsletters, automations, contact management	Yes (up to 500 contacts)	$13/mo+	Email newsletters, basic marketing automation	3
Beehiiv	Email newsletter platform — simpler, newsletter-focused	Yes (up to 2,500 subs)	$39/mo+ (Scale)	Newsletter-first businesses, content creators	2
Cal.com	Appointment scheduling — open source alternative	Yes (basic)	$12/mo (Team)	Scheduling if you want more control, open source	2
Calendly	Appointment scheduling — most popular option	Yes (1 event type)	$10/mo (Standard)	Simple appointment booking, client meetings	1
Zapier	Automation — connects apps to each other, no coding	Yes (limited)	$20/mo+ (Starter)	Connecting your tools together, automating repetitive tasks	3
Make.com	Automation — more complex workflows, visual builder	Yes (limited)	$9/mo+ (Core)	More complex automations, budget-conscious	4
HubSpot CRM	Customer relationship management — contacts, deals, pipeline	Yes (basic CRM)	$20/mo+ (Starter)	Tracking leads and customers, sales pipeline	3
Vapi	AI voice agents — phone-based AI assistants	Dev tier available	Usage-based pricing	Businesses that miss calls, after-hours answering	4
Retell	AI voice agents — phone-based AI assistants	Dev tier available	Usage-based pricing	Inbound call handling, appointment scheduling by phone	4
Google Sheets	Spreadsheets — free, cloud-based, surprisingly powerful with AI add-ons	Yes (full)	Free (part of Google)	Everything. Tracking, budgets, inventory, planning	2

A few notes:

ChatGPT and Claude are where most people should start. They're general purpose, easy to use, and immediately useful. Try both on the free tier and see which one fits how you think.

Canva is the answer to "I need a social media graphic but I'm not a designer." It's not Photoshop. That's the point.

Zapier and Make.com are for when you're ready to connect tools together — like "when someone fills out my website form, add them to my email list and send them a welcome email

automatically." You don't need this on day one. You might need it by month three.

Vapi and Retell are for businesses that live and die by the phone. If you're a contractor, a healthcare office, or any business where a missed call is a missed customer, these are worth investigating. They have a real learning curve, though. This might be where you want help.

Appendix C: The BS Detector Checklist

Print this page. Take it to any meeting with an AI vendor, consultant, or that guy at the networking event who just started an AI company last month.

Before the Meeting: 10 Questions That Flag Problems

Answer YES or NO. Each YES is a red flag.

1. Are they guaranteeing specific results? "We guarantee a 40% increase in leads." Nobody can guarantee that. If they could, they'd be doing it for themselves, not selling it to you. □ YES (red flag) □ NO

2. Is the pricing unclear or "custom" with no ballpark? "It depends on your needs" is fine for a first conversation. If you still can't get a number range by the second conversation, something's wrong. □ YES (red flag) □ NO

3. Do they avoid answering "What happens if it doesn't work?" Any honest vendor has a plan for when things go sideways. If they won't talk about failure scenarios, they haven't thought about them. □ YES (red flag) □ NO

4. Are they using jargon they can't explain simply? "We leverage neural network architectures to optimize your customer journey." Ask them to explain that in plain English. If they can't, they either don't understand it themselves or they're trying to intimidate you into buying. □ YES (red flag) □ NO

5. Do they want a long-term contract before you've seen results? 12-month minimums before you've seen anything work? No. A reasonable vendor lets you start small and expand. Lock-in contracts protect them, not you. □ YES (red flag) □ NO

6. Are they dismissive of your current systems? "You need to replace everything." Usually you don't. Someone who respects your existing business will work with what you have, not demand you tear it down. □ YES (red flag) □ NO

7. Can they show you a working example with a similar business? Not a case study from a Fortune 500 company. A real example with a business roughly your size, in a roughly similar industry. If they can't, you might be their first real client. That's not automatically bad, but you should know it. □ YES (red flag — they can't show one) □ NO

8. Are they creating urgency that doesn't exist? "This price is only good until Friday." "Your competitors are already using this." Pressure tactics are a sign they're selling, not helping. □ YES (red flag) □ NO

9. Will you own your data and content? If you stop working with them, do you keep everything they built? Your customer lists? Your content? Your workflows? If the answer is no or unclear, you're renting, not building. □ YES (red flag — you won't own it) □ NO

10. Is their own business hard to verify? Google them. Check their website. Look for reviews. See how long they've been operating. If their LinkedIn was created last month and their website is a single landing page, proceed with extreme caution. □ YES (red flag) □ NO

Scoring

Count your YES answers.

0-3 red flags: Probably fine. No vendor is perfect. A couple of minor flags might just be clumsy salesmanship rather than malicious intent. Proceed, but keep your eyes open and start small.

4-6 red flags: Proceed with caution. Something's not right. It might be fixable — maybe they're new and their sales process is rough. Or maybe they're not the right fit. Ask more questions. Get references. Don't sign anything today.

7+ red flags: Walk away. This has "expensive lesson" written all over it. You can find someone better. The fact that you're reading this book means you're already smart enough to know that not every opportunity is a good one.

The One Question That Matters Most

At the end of any meeting, ask this:

"If I do nothing for six months and then come back, will this offer still be available?"

If yes: good sign. They believe in what they're selling and they're willing to wait for you to be ready.

If no: ask why. There might be a legitimate reason (they're raising prices, limited capacity). But usually, the answer reveals whether they're focused on helping you or closing a deal.

Final Rule

If your gut says something's off, it probably is. You've been running a business in this town long enough to know when someone's being straight with you and when they're not. AI doesn't change that. Trust your instincts. They got you this far.
